

Earth's Climate: Past, Present and Future; Concerns and Solutions

Week 2: Wednesday April 6, 2016

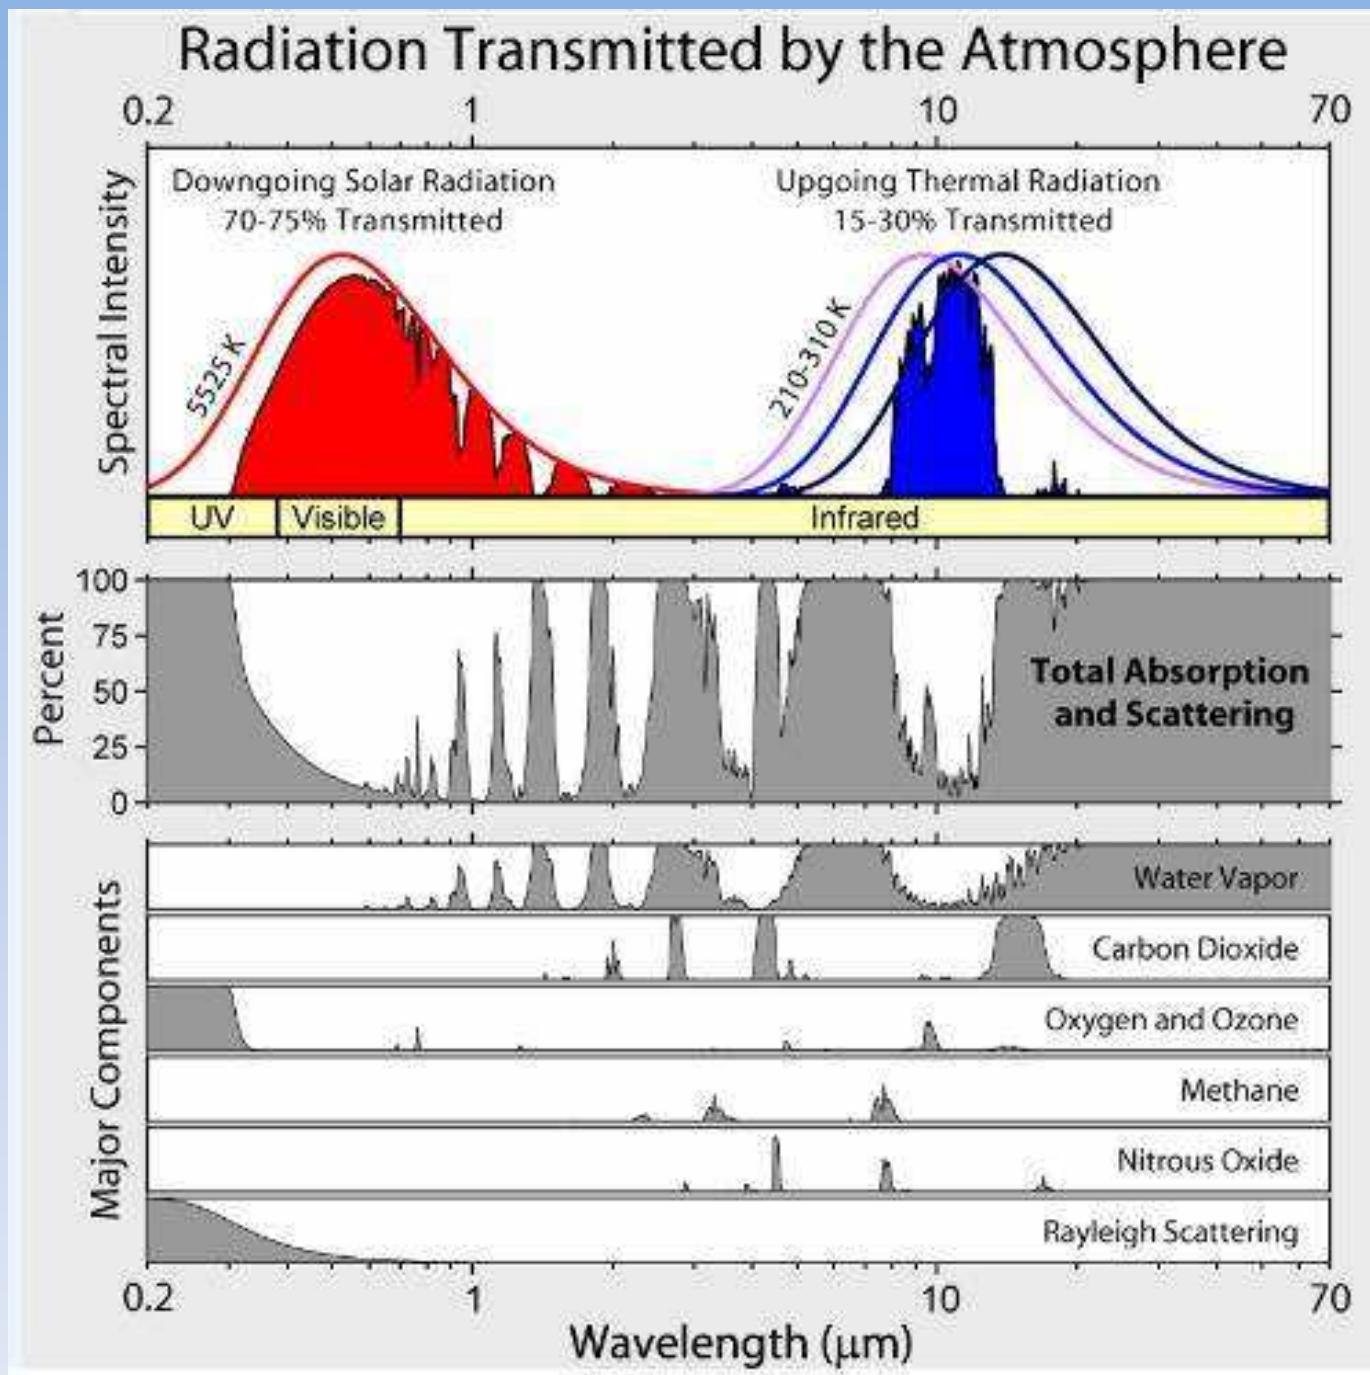

Paul Belanger

Earth's past climate history and what caused those changes

1. Earth's deep past before the Cambrian (600 MaBP): hot and cold
2. Earth's past: Cambrian onward: mostly hot-house Earth; 100s parts per million (ppm)
3. Climate trend in the Cenozoic – the last 65 million years; proxy data from 3600ppm to <200 ppm.
4. More recent past: 180-280 part per million; how do we know – empirical data. Preview of next week's field trip
5. Today: 400 ppm and growing 2-3ppm/year

But first

- A few thoughts / slides from last week

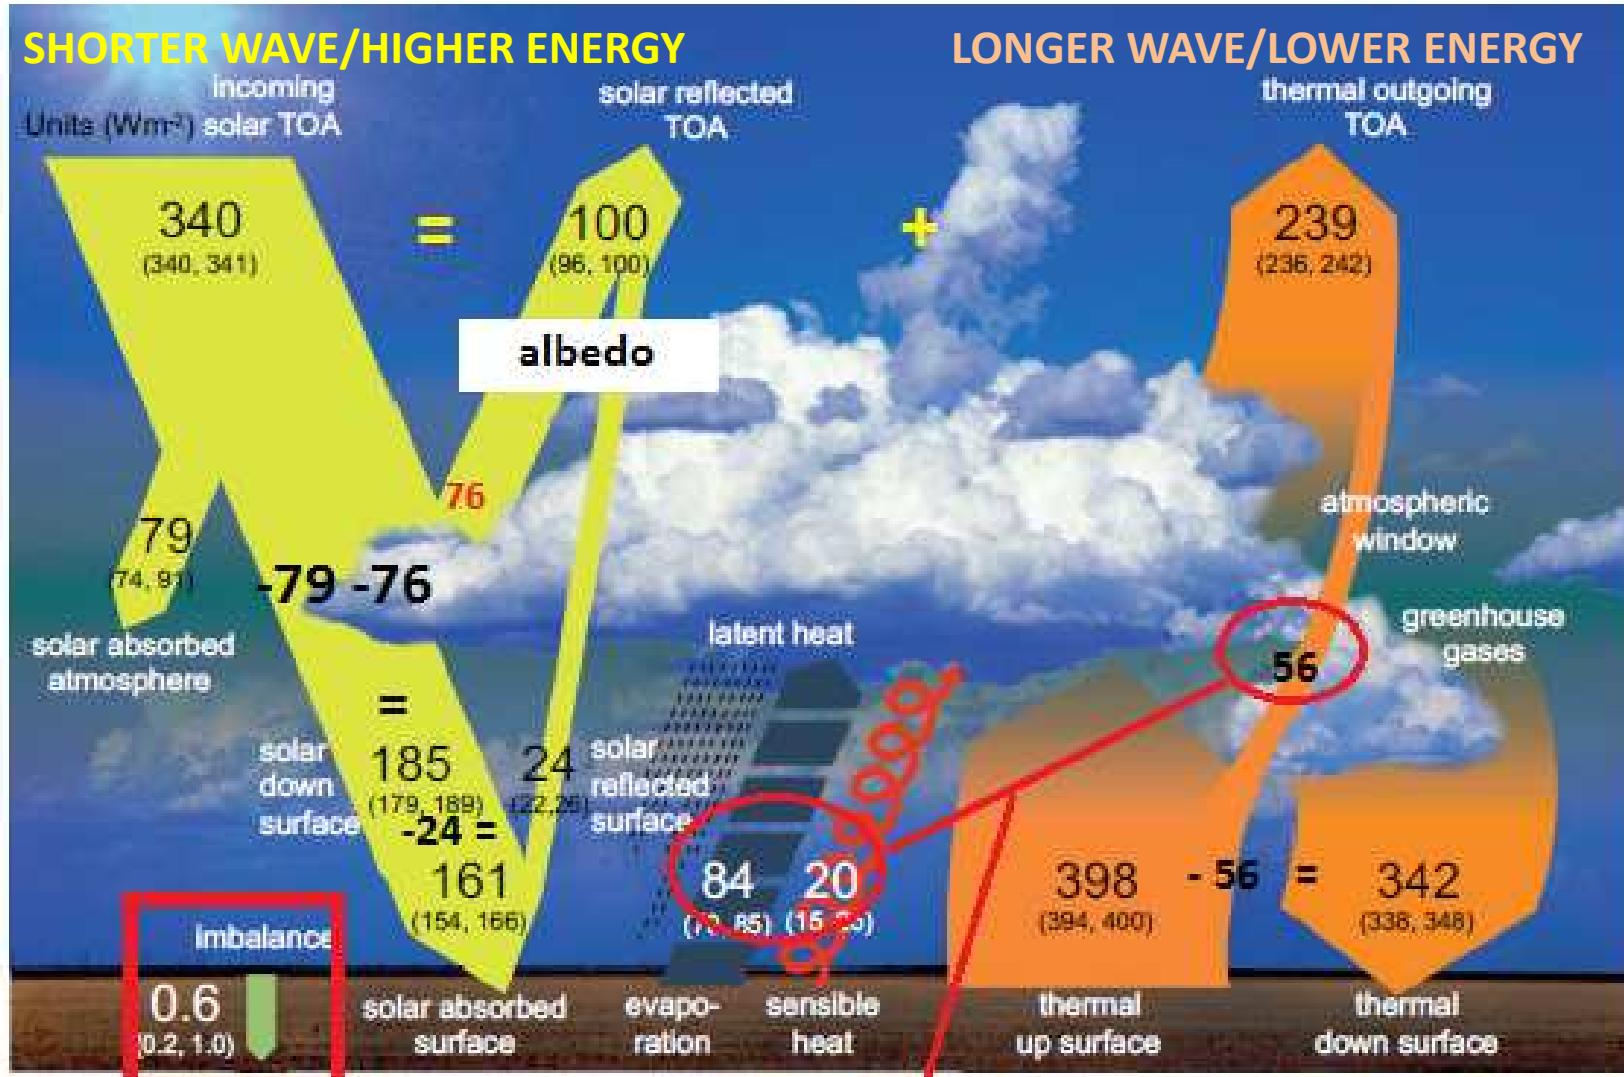

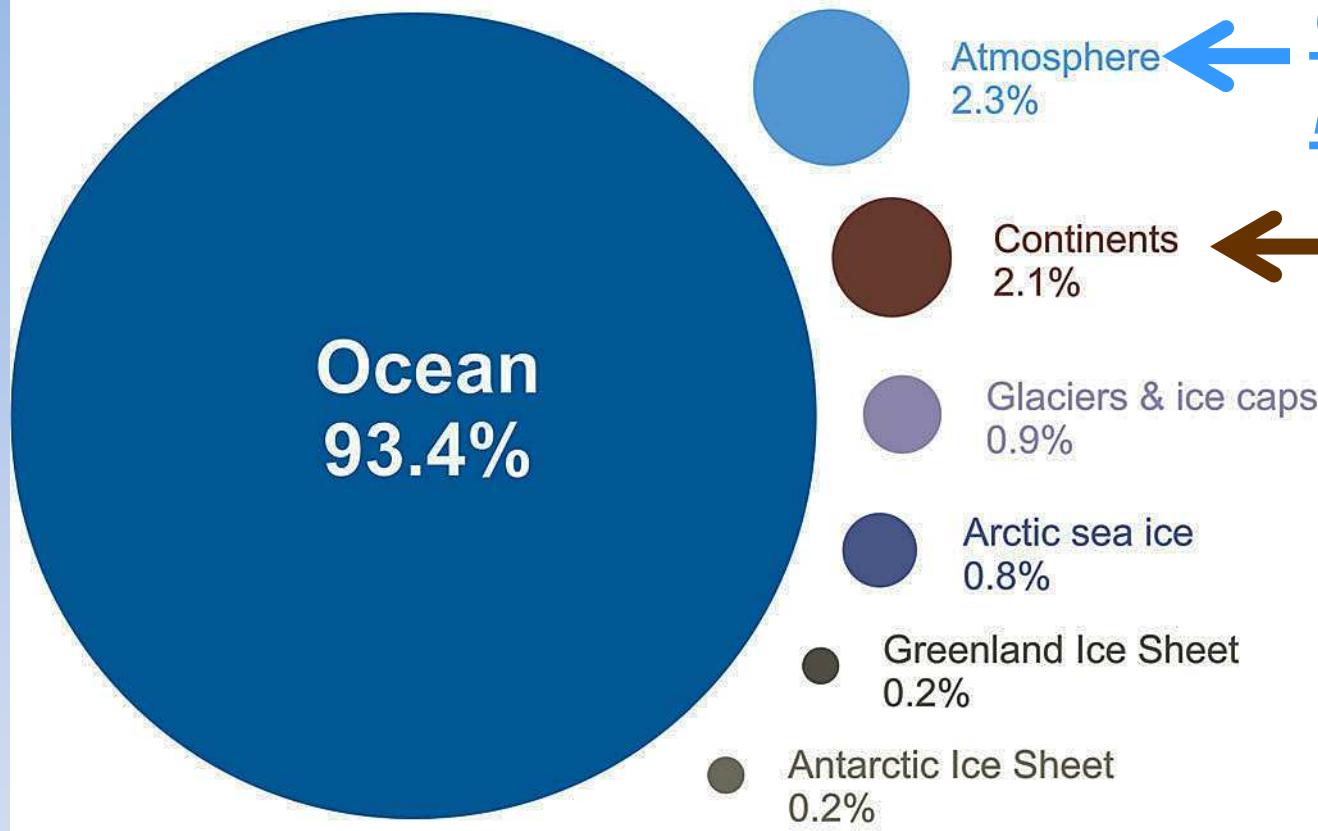

Figure 2.11: Global mean energy budget under present-day climate conditions. Numbers are magnitudes of the individual energy fluxes in W m⁻², adjusted within their uncertainty ranges to close the energy budgets. Numbers in parentheses attached to the energy fluxes cover the range of values in line with observational constraints. (Adapted from Wild et al., 2013.)

161 + 342 = 503 - 2 outside
vs. 84+20+398=502 - 3 inside
arrows

$$84 + 20 + 56 = 160$$

which =~ incoming 161 shortwave

Where is global warming going?

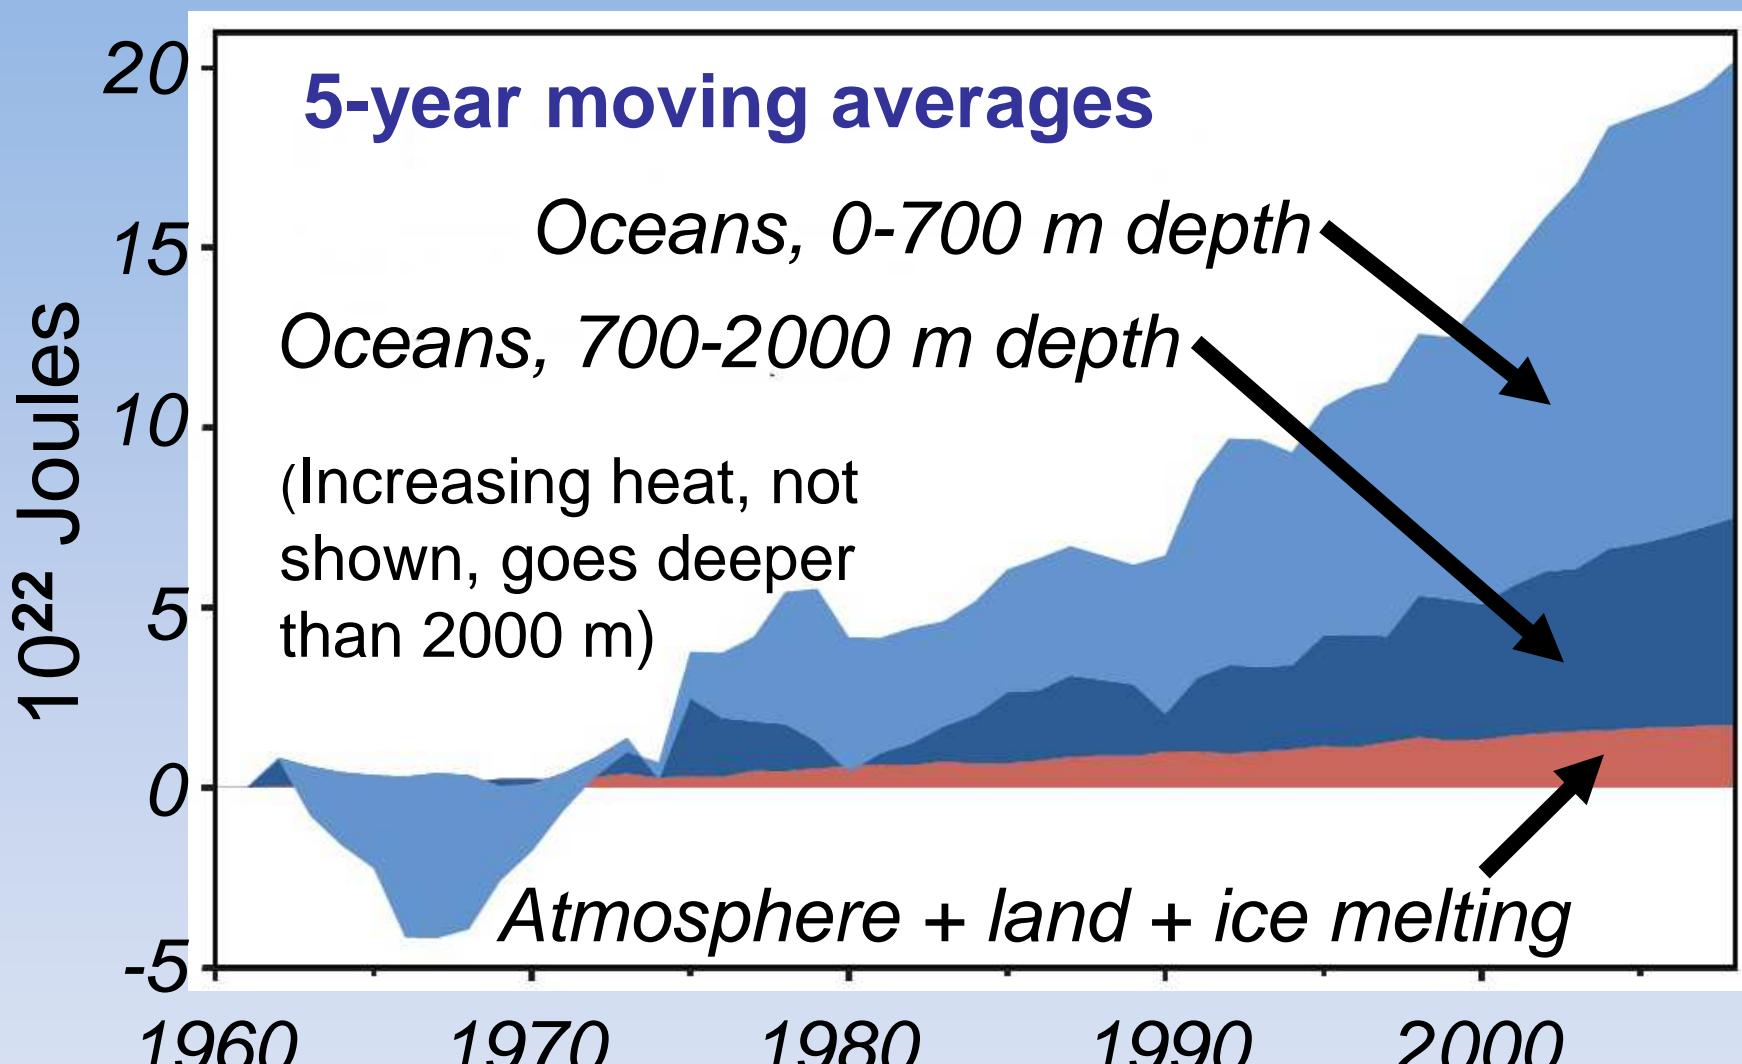

Only ~2% stays
in atmosphere

**~2% warms
the land**

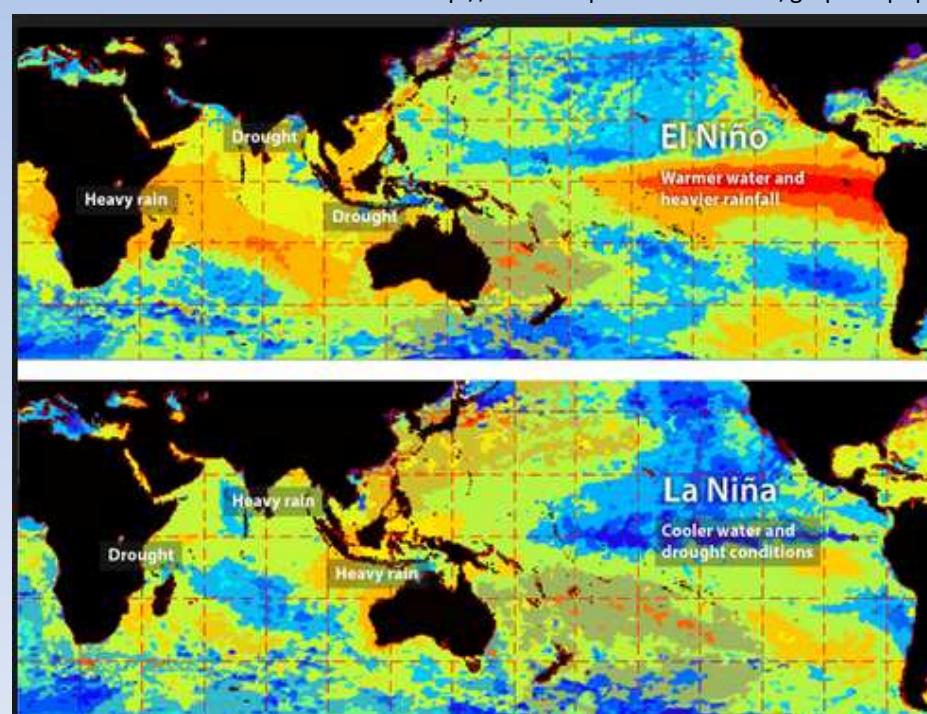

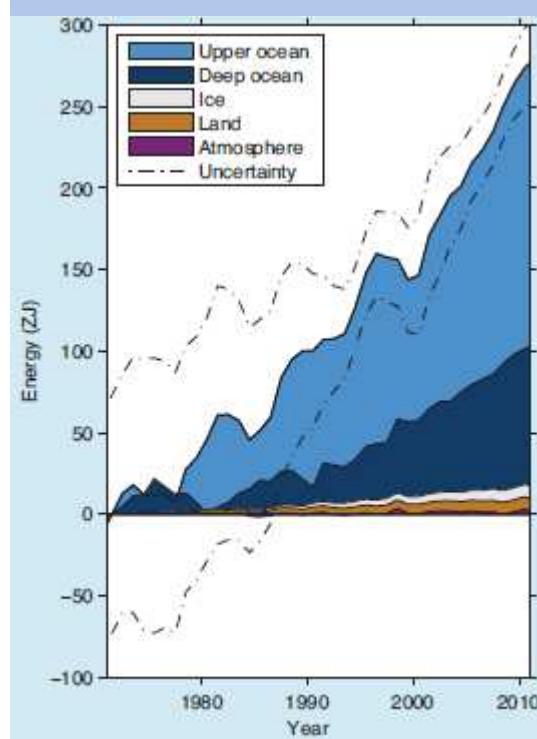

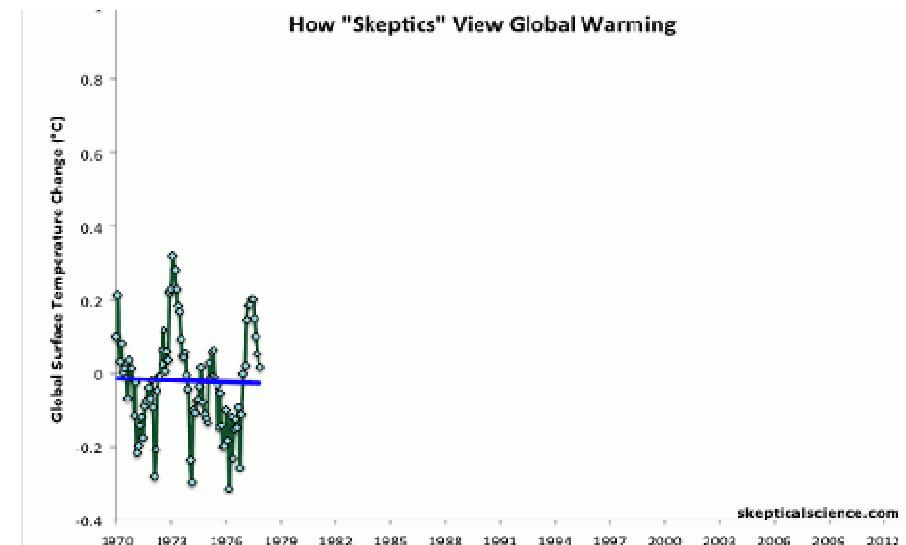

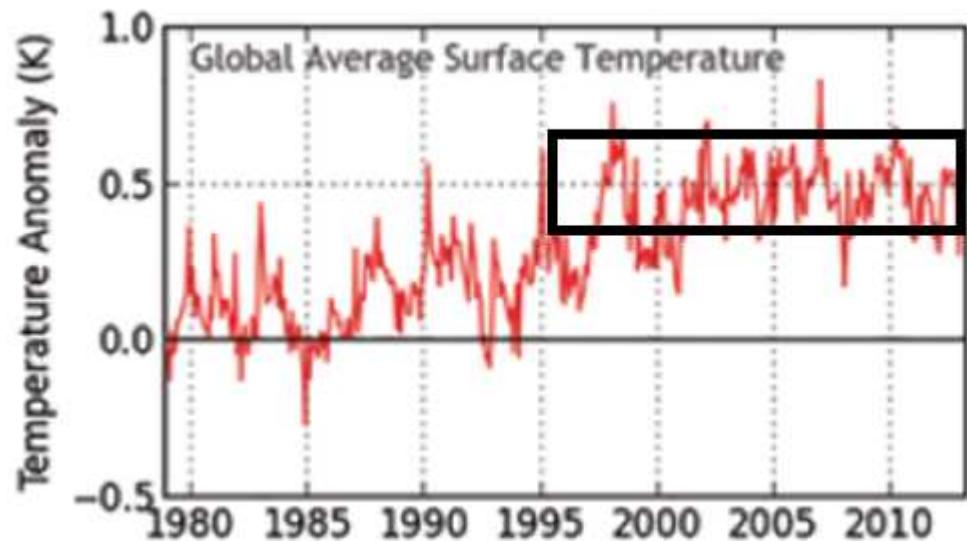

**Melting ice
absorbs ~2%**

John Cook, from IGPP 2007 data; ~93% to oceans continues (NOAA/NODC, 2012)

Change in heat content, 1958-2011

(NOAA 2012 data, Nuccitelli et al. 2012 plot)

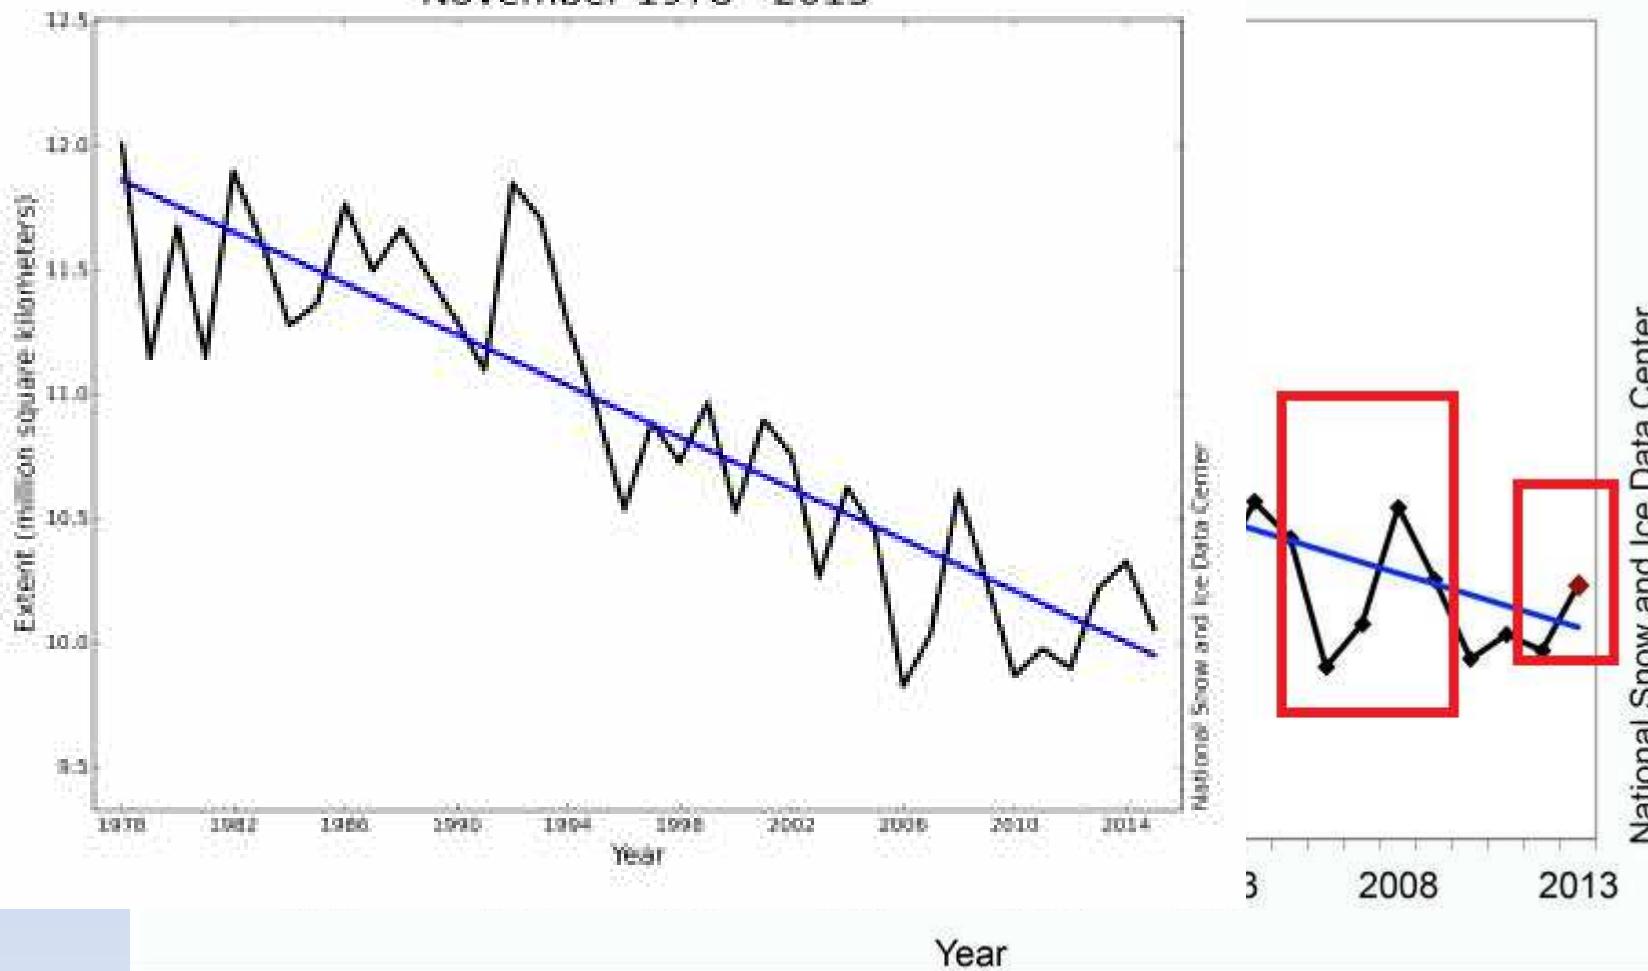

Box 3.1, Figure 1 | Plot of energy accumulation in ZJ ($1 \text{ ZJ} = 10^{21} \text{ J}$) with

Average Monthly Arctic Sea Ice Extent

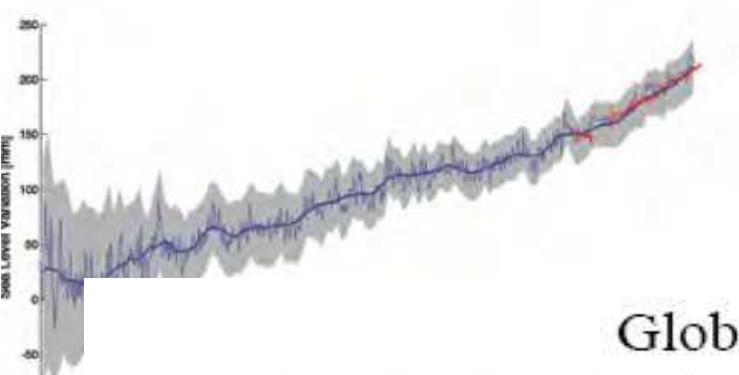

Average Monthly Arctic Sea Ice Extent

14: HOW FAST IS SEA LEVEL RISING?

Global Mean Sea Level Change

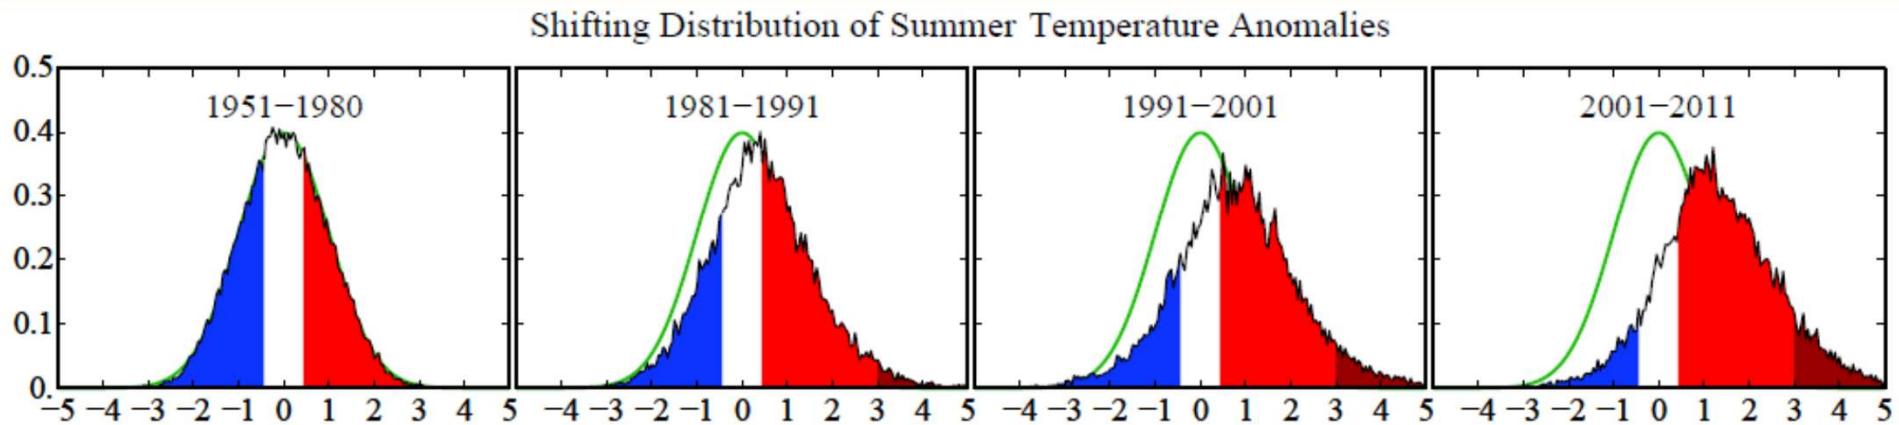

Blue: Sea level change from tide-gauge data (*Church J.A. and White N.J., Geophys. Res. Lett. 2006; 33: L01602*)
Red: Univ. Colorado sea level analyses in satellite era (<http://www.columbia.edu/~mhs119/SeaLevel/>).

Loaded Climate Dice: global warming is increasing extreme weather events.

Extreme summer heat anomalies now cover about 10% of land area, up from 0.2%.

This is based on observations, not models.

Frequency of occurrence (vertical axis) of local June-July-August temperature anomalies (relative to 1951-1980 mean) for Northern Hemisphere land in units of local standard deviation (horizontal axis). Temperature anomalies in the period 1951-1980 match closely the normal distribution ("bell curve", shown in green), which is used to define cold (blue), typical (white) and hot (red) seasons, each with probability 33.3%. The distribution of anomalies has shifted to the right as a consequence of the global warming of the past three decades such that cool summers now cover only half of one side of a six-sided die, white covers one side, red covers four sides, and an extremely hot (red-brown) anomaly covers half of one side.

Tricky question related to gas laws

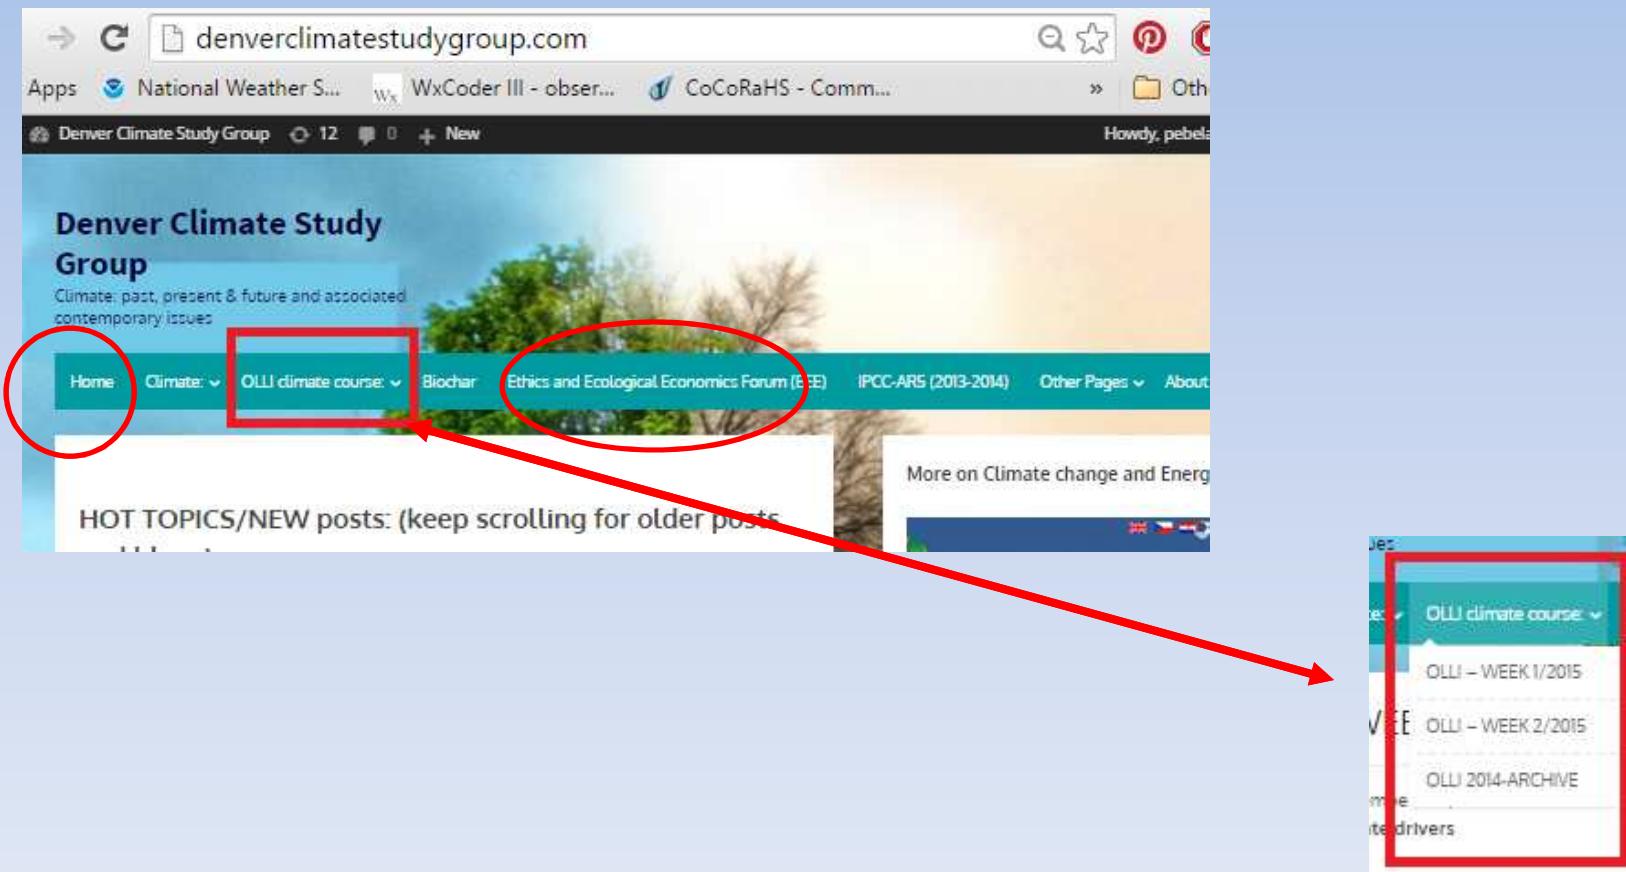

- TOA – TOP OF ATMOSPHERE
- Which is denser: 2 = ROOMS, BOTH SAME TEMP.
 - A. 100% HUMIDITY
 - B. 20% HUMIDITY
- El Nino/La Nina map and world temperatures

Explanation

- GAS LAWS
 - N₂ (78%), atomic mass 14 (7p/7n) x 2 = 28
 - O₂ (21%), atomic mass 16 (8p/8n) x2 = 32
 - H₂O (varies <1%), H – 1p x 2 = 2 + 16 = 18
- Water vapor mixed in air makes it LESS DENSE
- Why rain associated with LOW pressure
- Joule (ISU), calorie, BTU
 - Takes 80 cal to melt ice; 1 cal (4.2J)/ °C; 540 c to steam

Past Earth History Objectives:

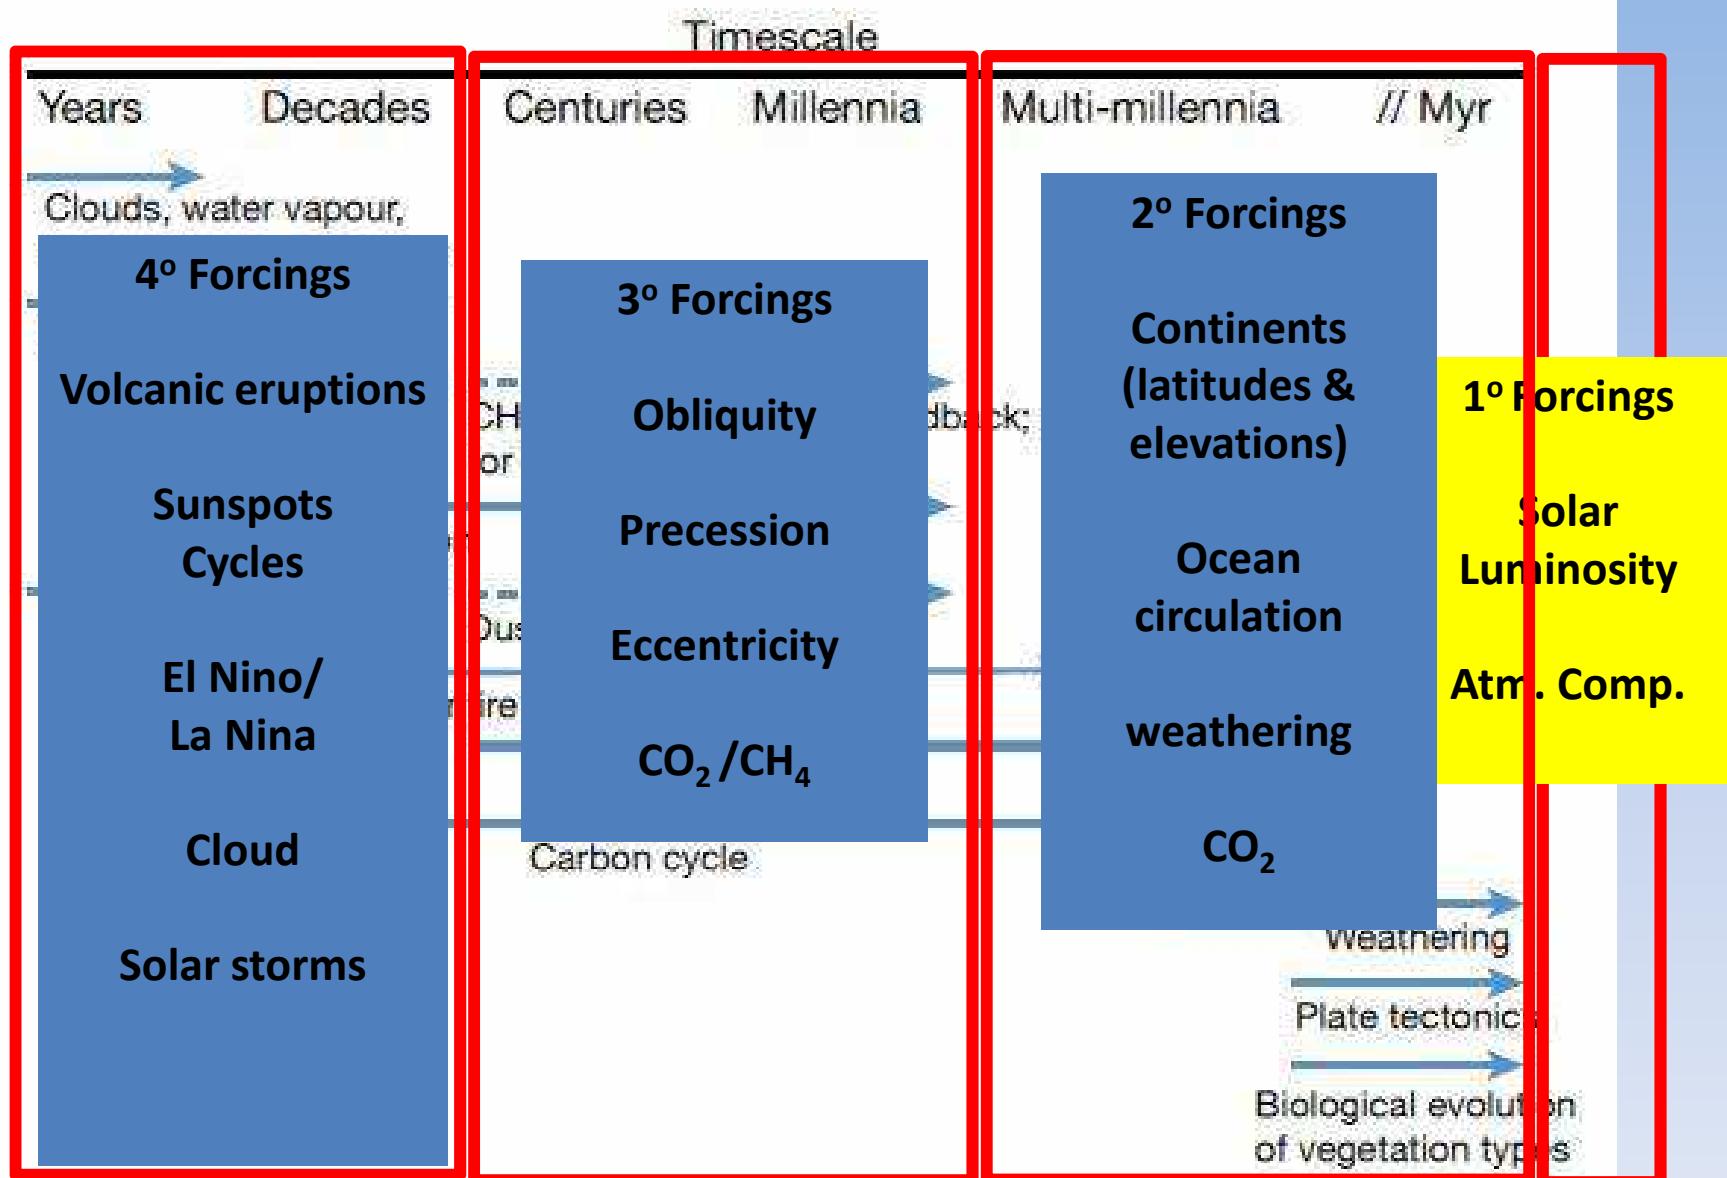

- 1. Present you with the geologic evidence; Earth's past**
- 2. Educate / That the science is sound**
- 3. Understand the denial movement and how to counter it**
- 4. Motivate you**
- 5. Give you hope / look at potential game changers**

- SO –
WHAT CONTROLS
CLIMATE

Gerhard et al., 2001

FEEDBACKS

Rohling, et al., (PALAESENS Project mbrs), 2012

Earth's past climate

Earth's past climate

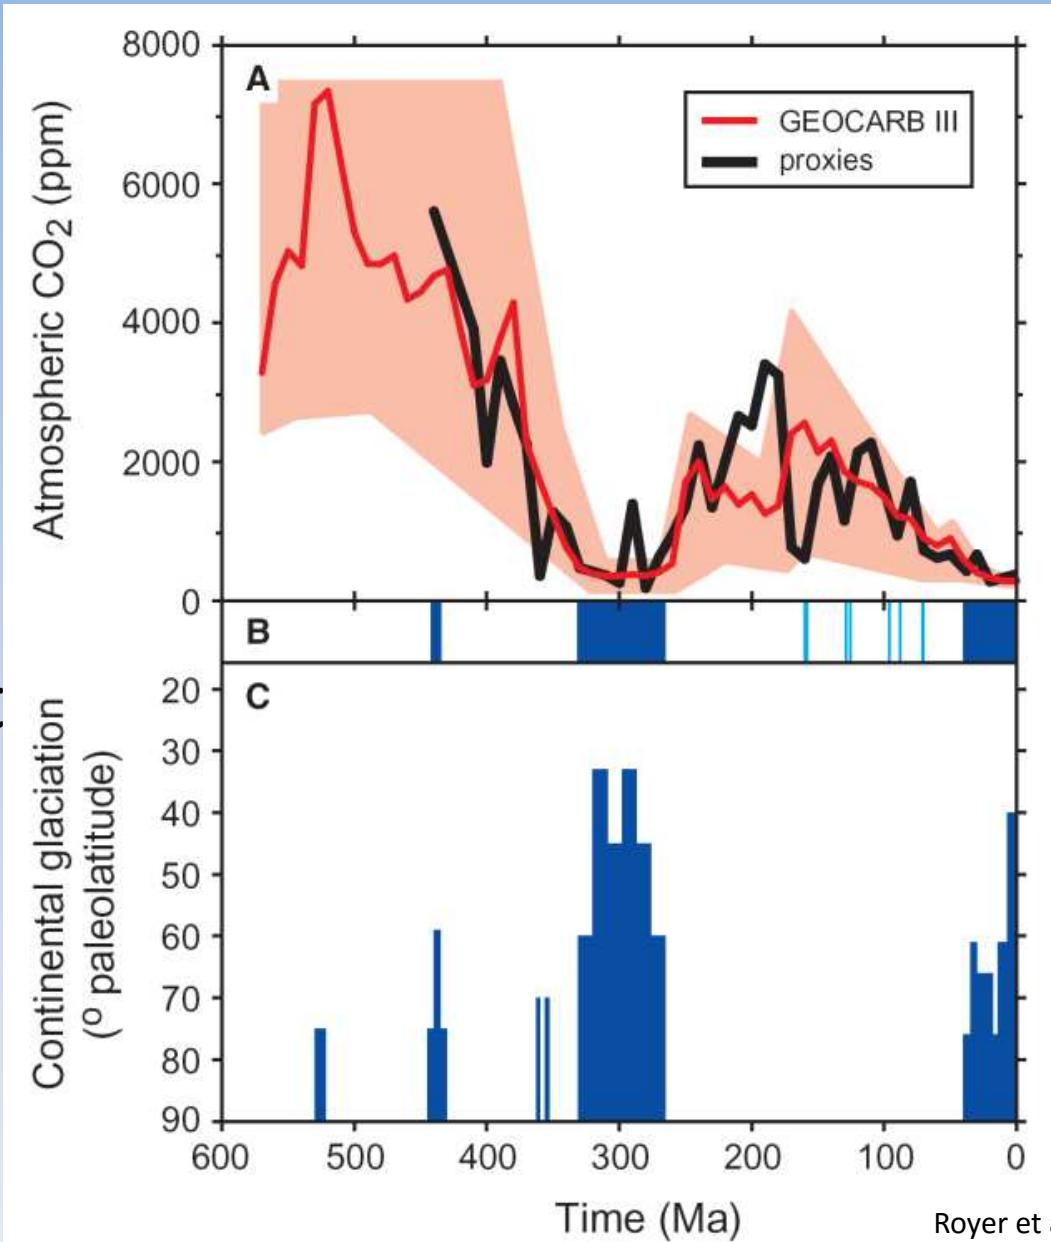

1. Earth's deep past before the Cambrian (600 MaBP): hot and cold
2. Earth's past: Cambrian onward: mostly hot-house Earth; 100s parts per million (ppm)
3. **Climate trend in the Cenozoic – the last 65 million years; proxy data from 3600ppm to <200 ppm.**
4. More recent past: 180-280 part per million; how do we know – empirical data. Preview of next week's field trip
5. Today: 400 ppm and growing

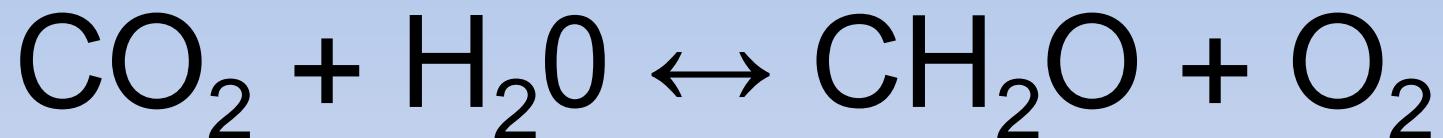

Scientific History of Climate change – PROXY DATA

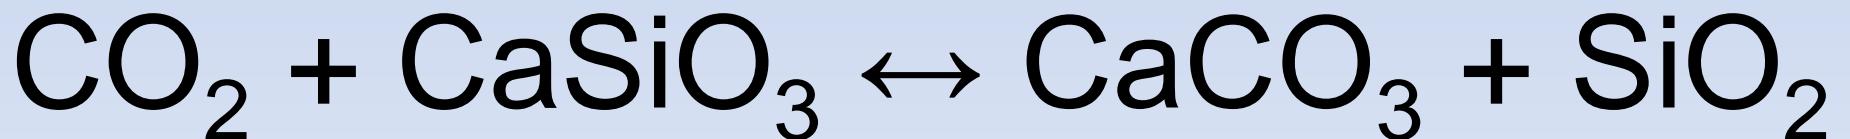

Long-term Carbon Cycle: rocks

Two generalized reactions...

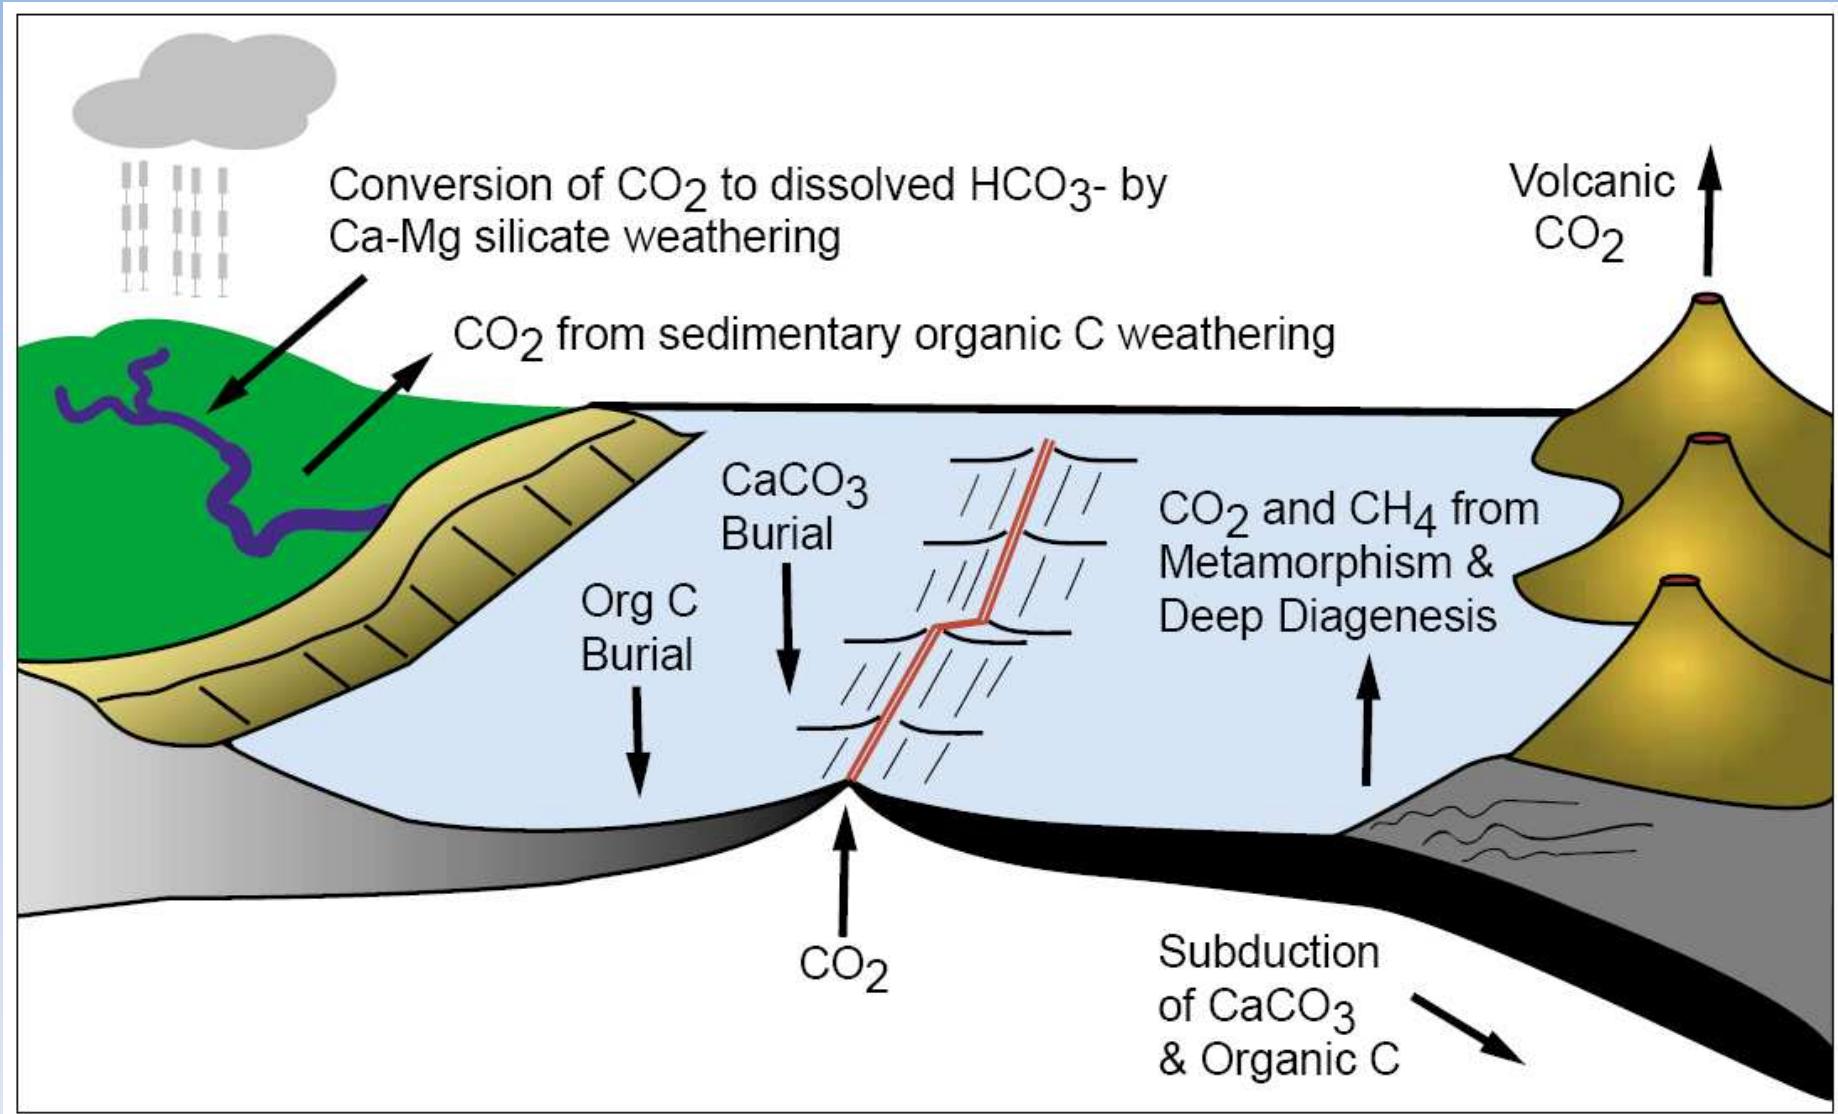

Photosynthesis/Respiration

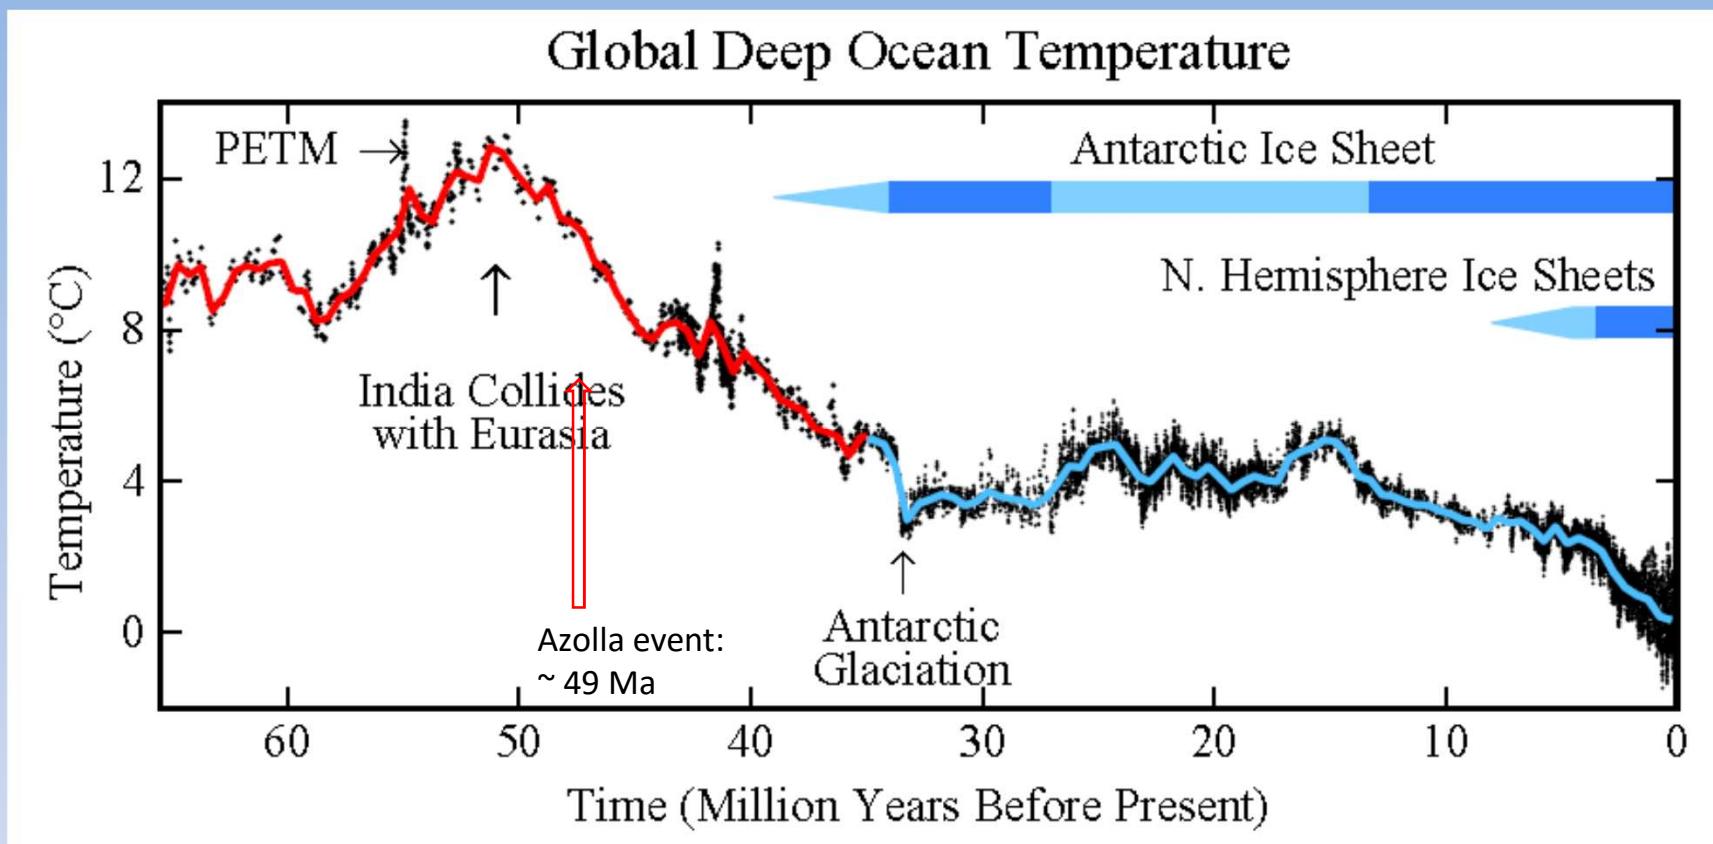

Weathering/Precipitation

Long-term carbon cycle: *rocks*

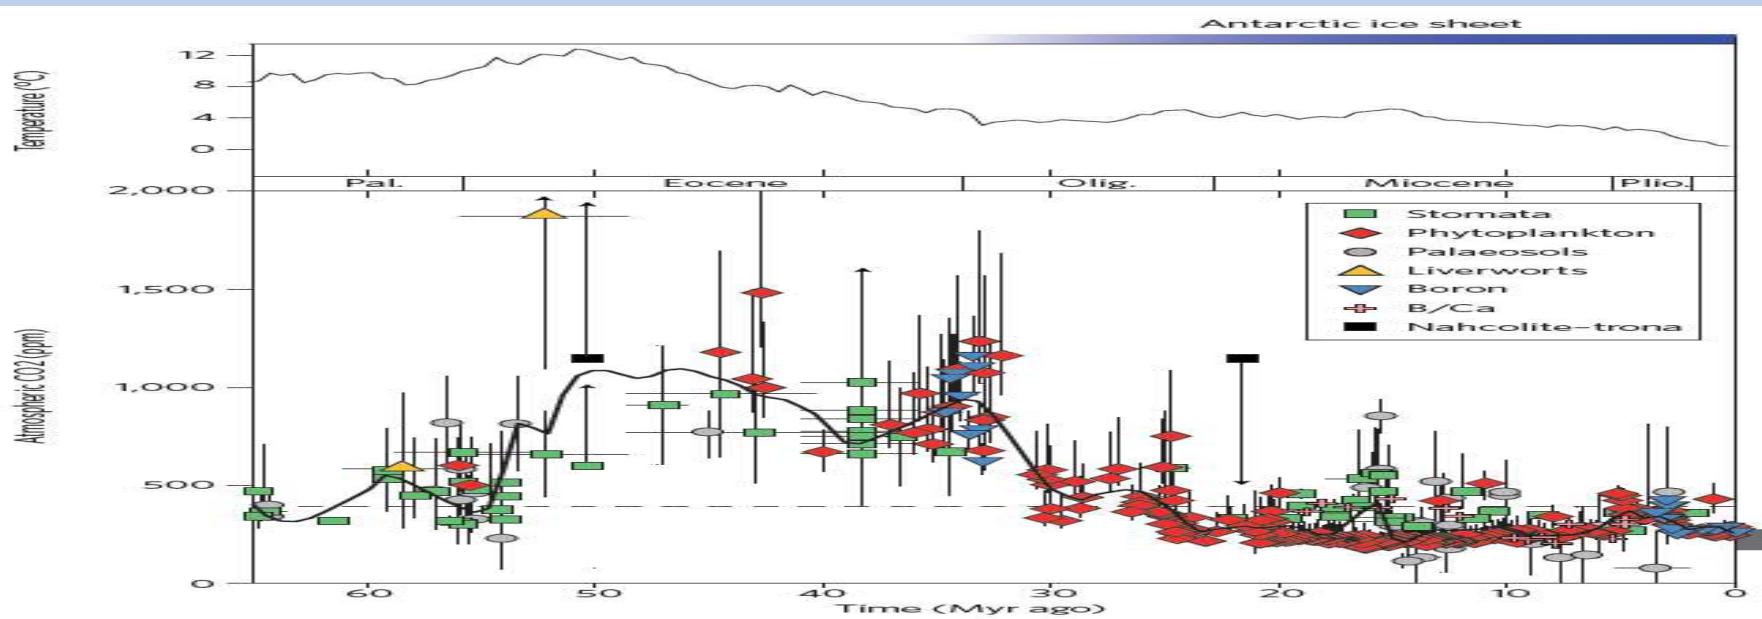

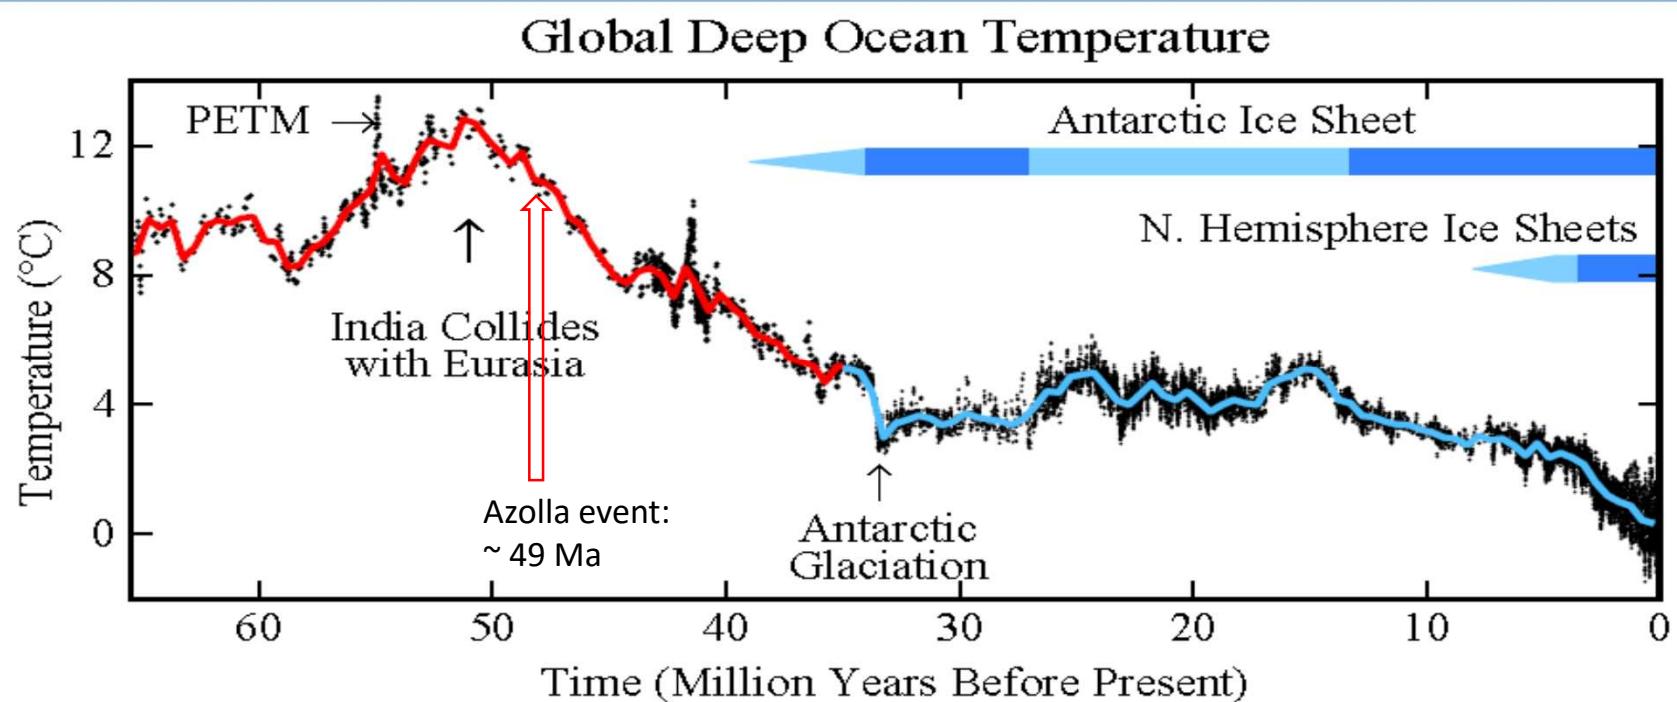

50 million years ago (50 MYA) Earth was ice-free.

Atmospheric CO₂ amount was of the order of 1000 ppm 50 MYA.

Atmospheric CO₂ imbalance due to plate tectonics $\sim 10^{-4}$ ppm per year.

So – what changed?

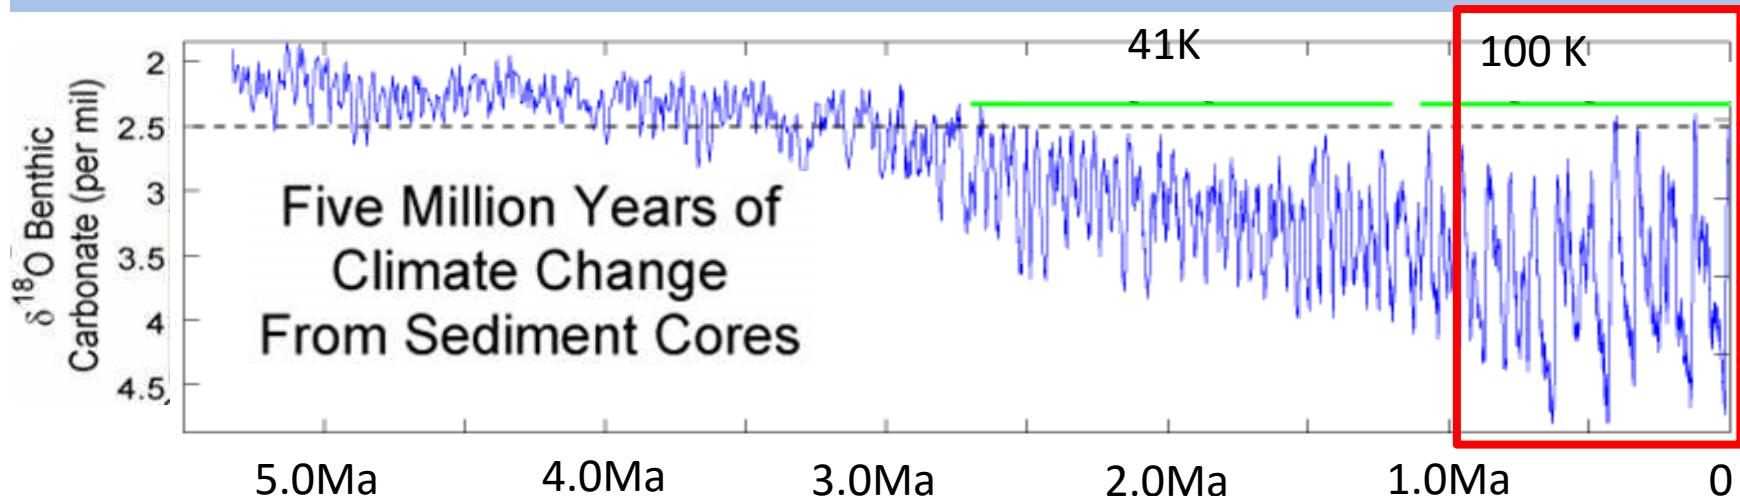

Volcanism decreased; some slowing of spreading rates: less CO₂ emitted by volcanoes

Weathering/Precipitation increased; India colliding into Asia/Himalayans

Earth's past climate

1. Earth's deep past before the Cambrian (600 MaBP): hot and cold
2. Earth's past: Cambrian onward: mostly hot-house Earth; 100s parts per million (ppm)
3. Climate trend in the Cenozoic – the last 65 million years; proxy data from 3600ppm to <200 ppm.
4. More recent past: 180-280 part per million; how do we know – empirical data. Preview of next week's field trip
5. Today: 400 ppm and growing

Climate Changes from Ocean Sediment Cores, since 5 Ma. Milankovitch Cycles

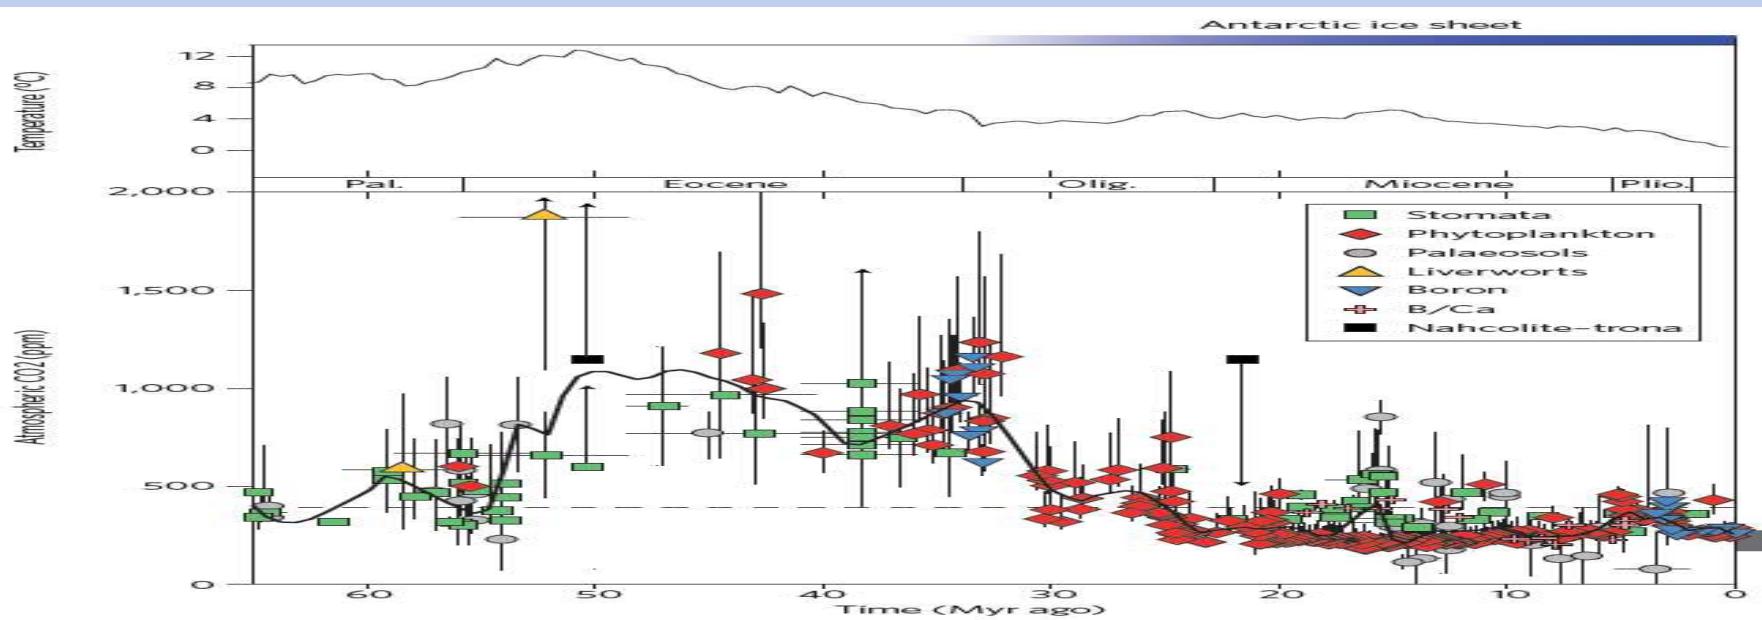

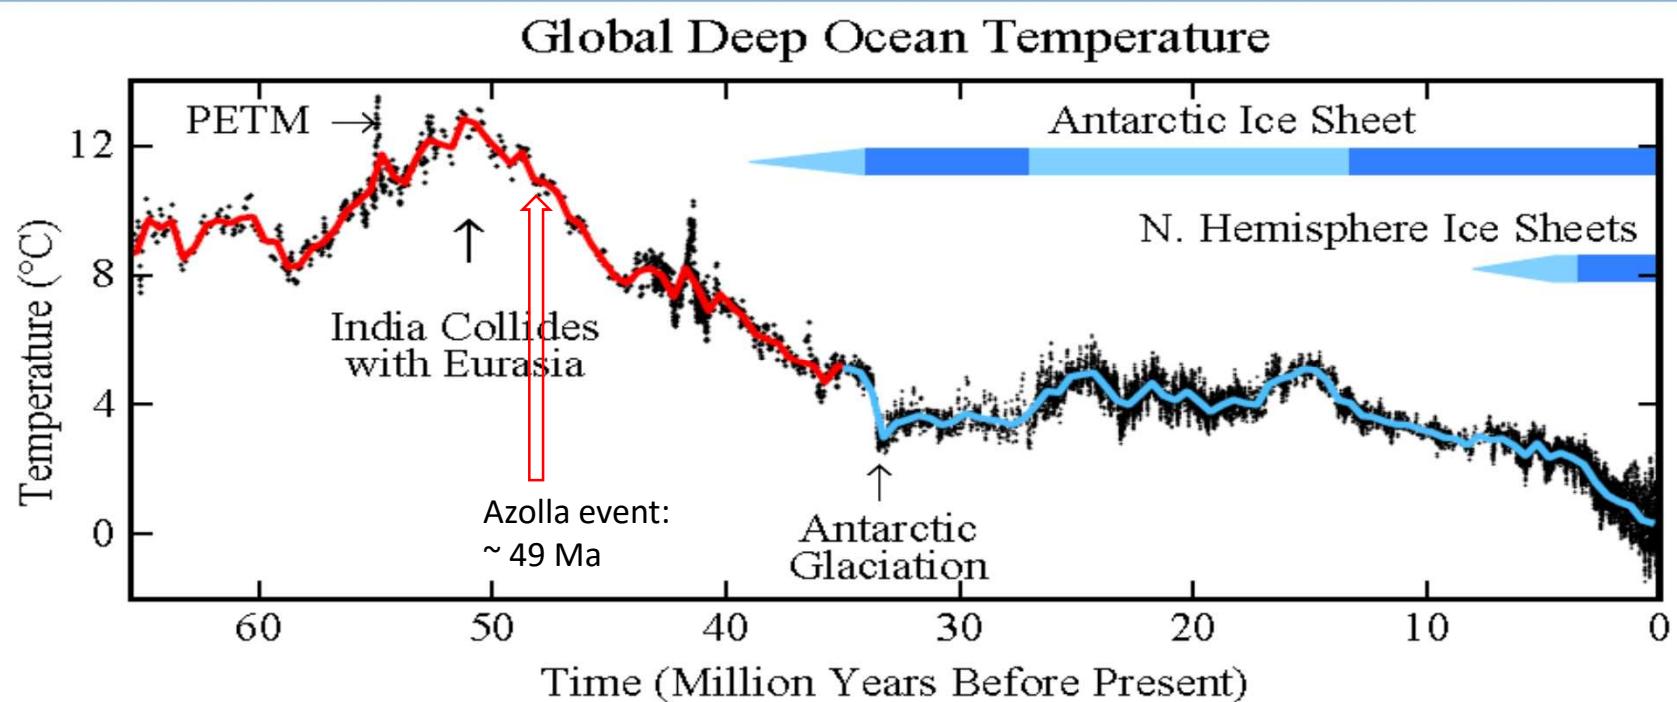

When CO₂ levels get below ~400-600 ppm Orbital parameters become more important than CO₂

- 5. Today: 400 ppm and growing**

**End of week 2
EXTRAS FOLLOW**

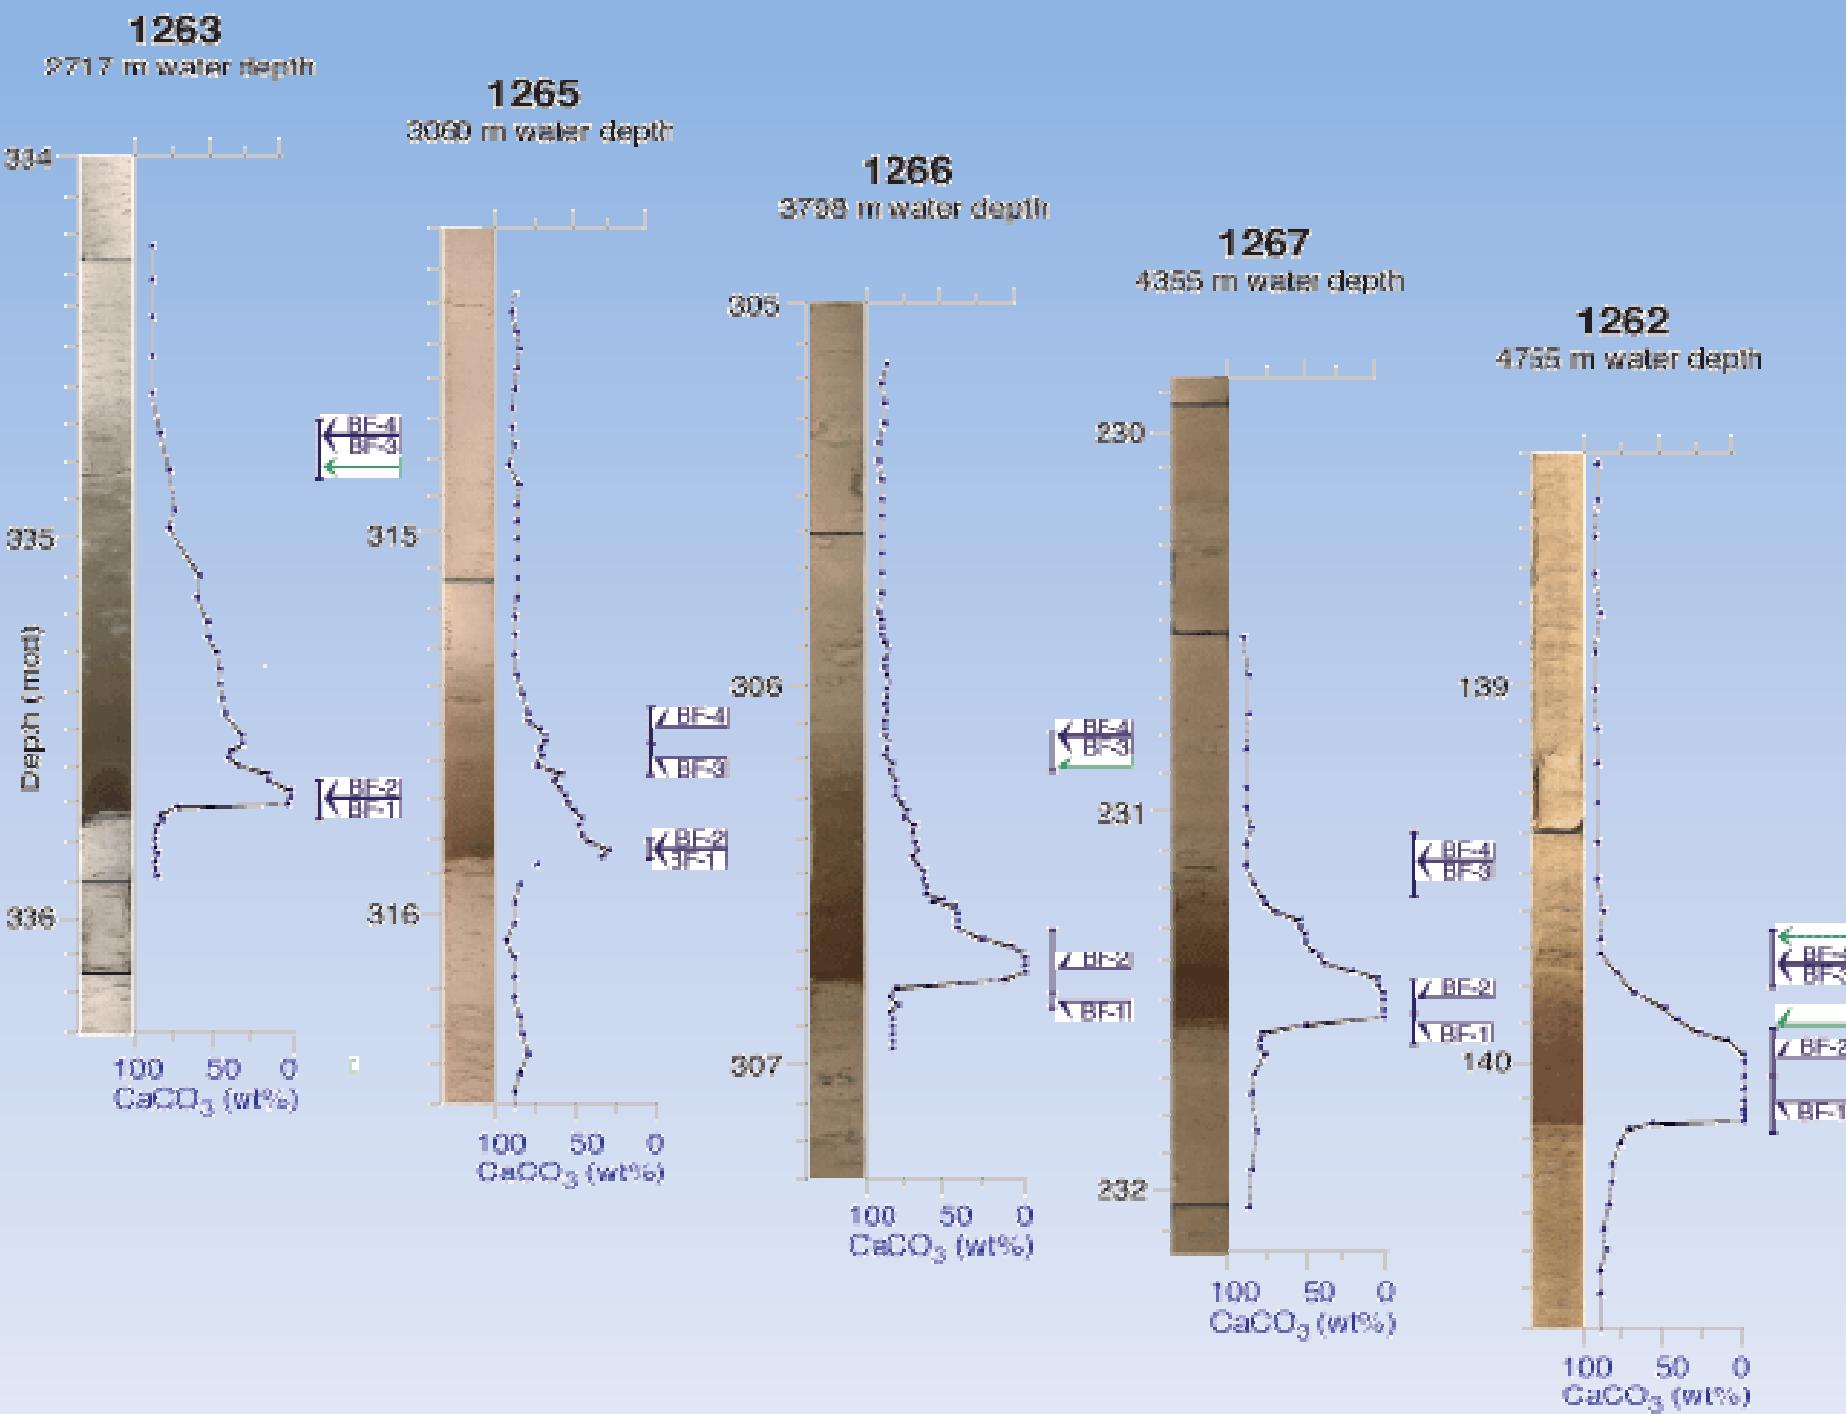

Paleocene/Eocene Thermal Maximum PETM

Proxy data: stable isotopes

PETM - THE LAND RECORD

Bighorn Basin

- PETM interval in fluvial deposits with excellent alluvial paleosols - seen as color bands, which are soil horizons
- Found in Willwood Fm
- Reds, purples due to iron oxides in B horizons

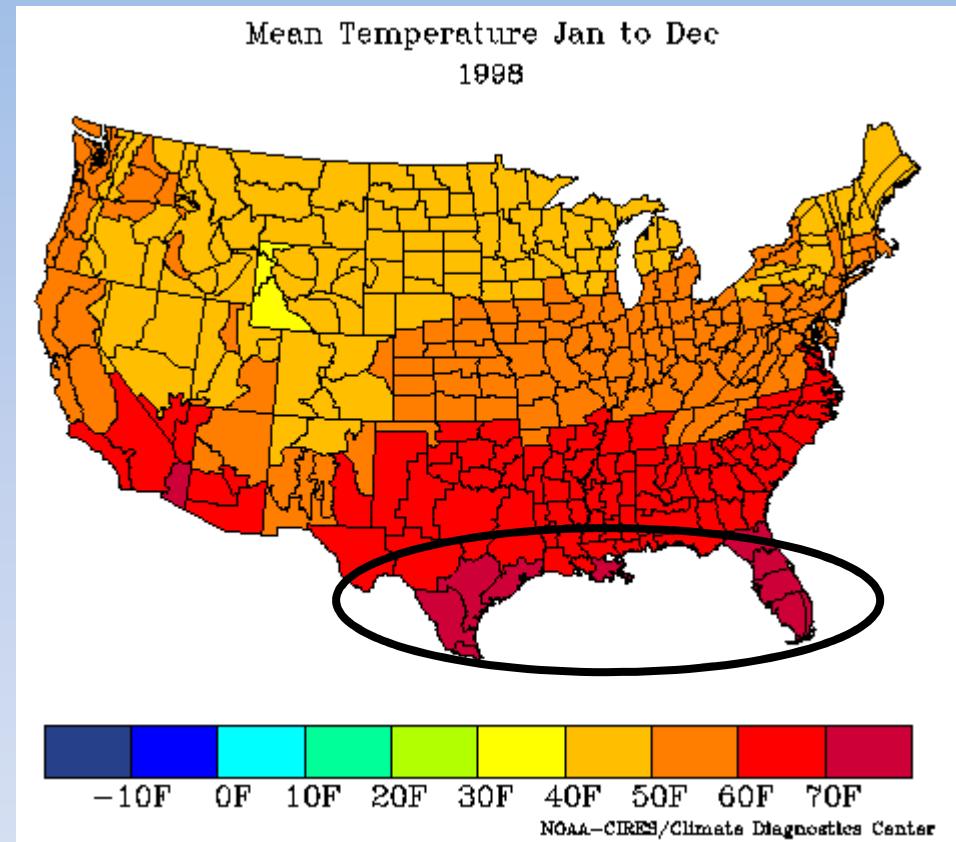

Paleosol Density

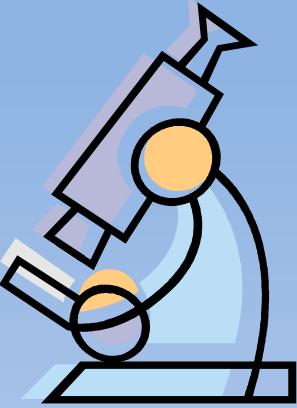

Bighorn Basin Climate

- Plant fossils and isotopes show Mean Annual Temperature of 20° to 25° C or 68 to 77° F
- Similar to Gulf Coast region today

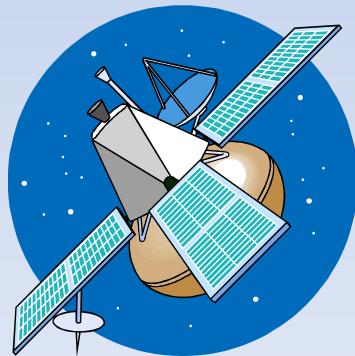

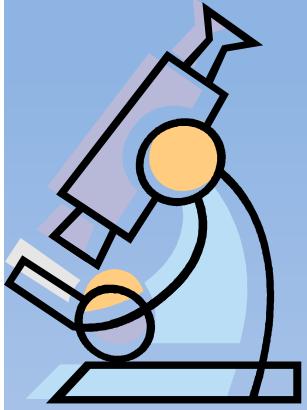

PROXY DATA-EXTRAS

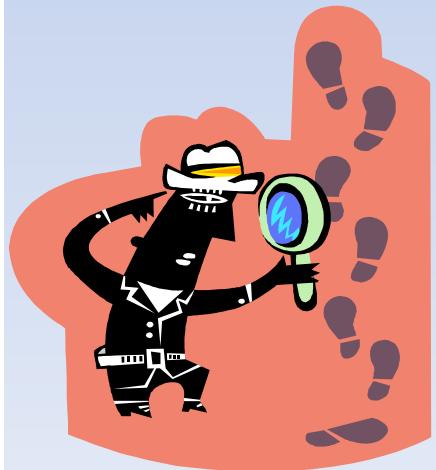

FROM CSI TO GSI: GEOLOGICAL SAMPLE INVESTIGATION

LET THE EVIDENCE SPEAK
FOR ITSELF

WE CALL THIS
EVIDENCE
“PROXY” DATA

SOME OF THE EARLIEST PROXY DATA WAS FROM TERRESTRIAL DEPOSITS

- Strandlines/shorelines
- Moraines
- Till
- Kettle lakes, etc.

We may know what caused these today, but imagine back then?

IT'S THE INTERPRETATION THAT'S NOT ALWAYS CORRECT

Darwin observed ancient Alpine shorelines:
interpreted as ocean shoreline
Agassiz – later correctly interpreted as ice-dammed lake-shore strandlines/shoreline

Louis Agassiz

Louis Agassiz

Born	May 28, 1807 Haut-Vully, Switzerland
Died	December 14, 1873 (aged 66) Cambridge, Massachusetts
Fields	Paleontology, Glaciology, Geology, Natural History
Alma mater	University of Erlangen-Nuremberg

- Jean Louis R. Agassiz

PROXY DATA: PLANKTONIC FORAMS

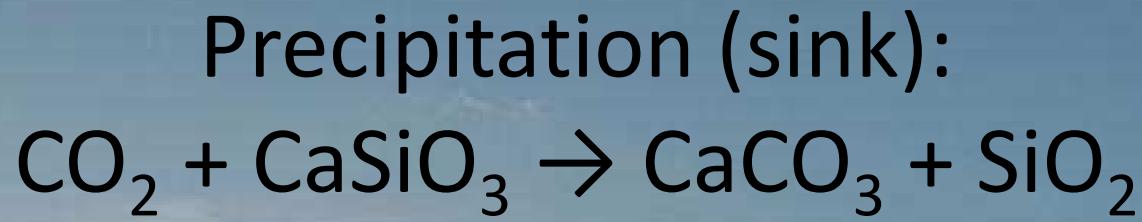

Deep Sea Coring

Ruddiman, 2008

The Azolla event

GUESS WHAT:

AS CONTINENTS DRIFT TO HIGH LATITUDES AND HIGHER ELEVATIONS
AND BECOME GLACIATED IT LEADS TO:

1. GREATER MECHANICAL WEATHERING OF SILICATES:

- increasing sequestration of CO_2 in sediments
- decreasing the amount in the atmosphere

ADDITIONALLY in the Cenozoic:

2. MID-OCEAN SPREADING RATES SLOW DOWN

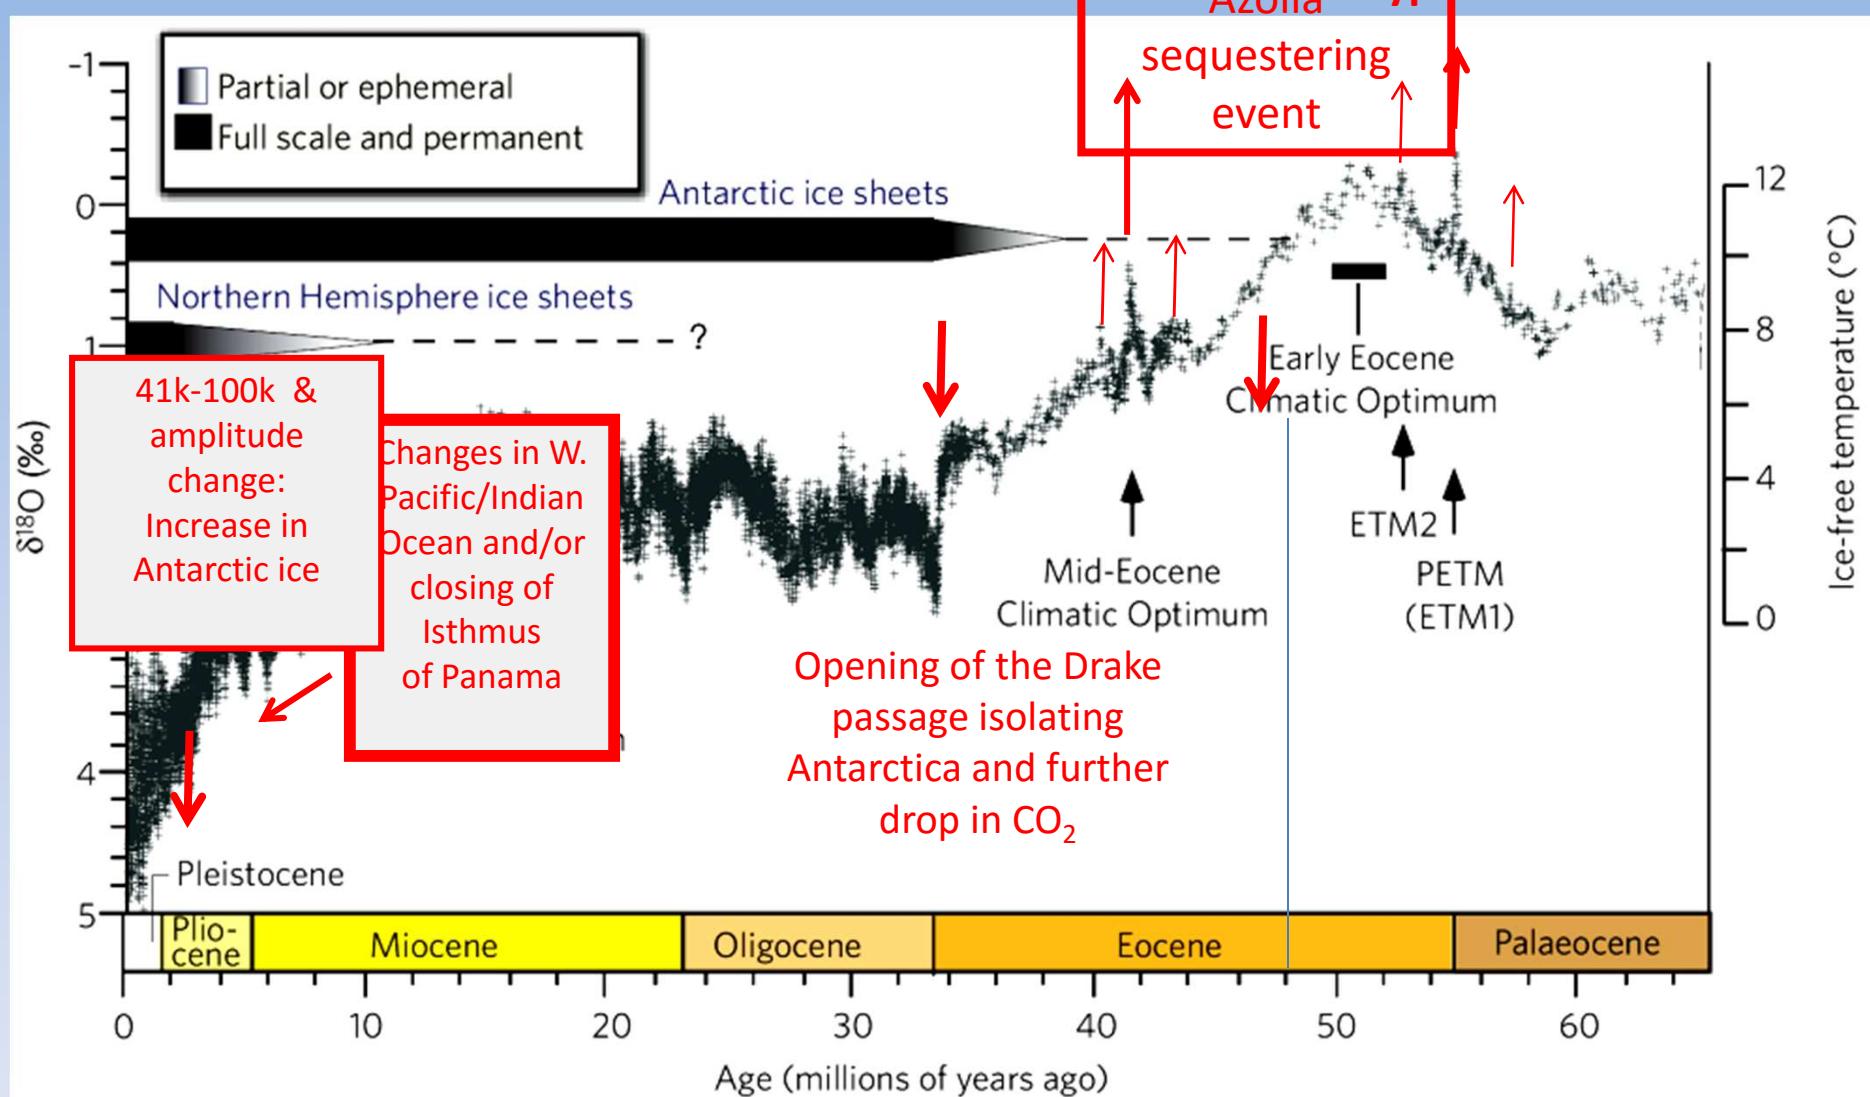

- Less CO_2 into the atmosphere for volcanoes

=

CO_2 DRAW DOWN THROUGH TIME!

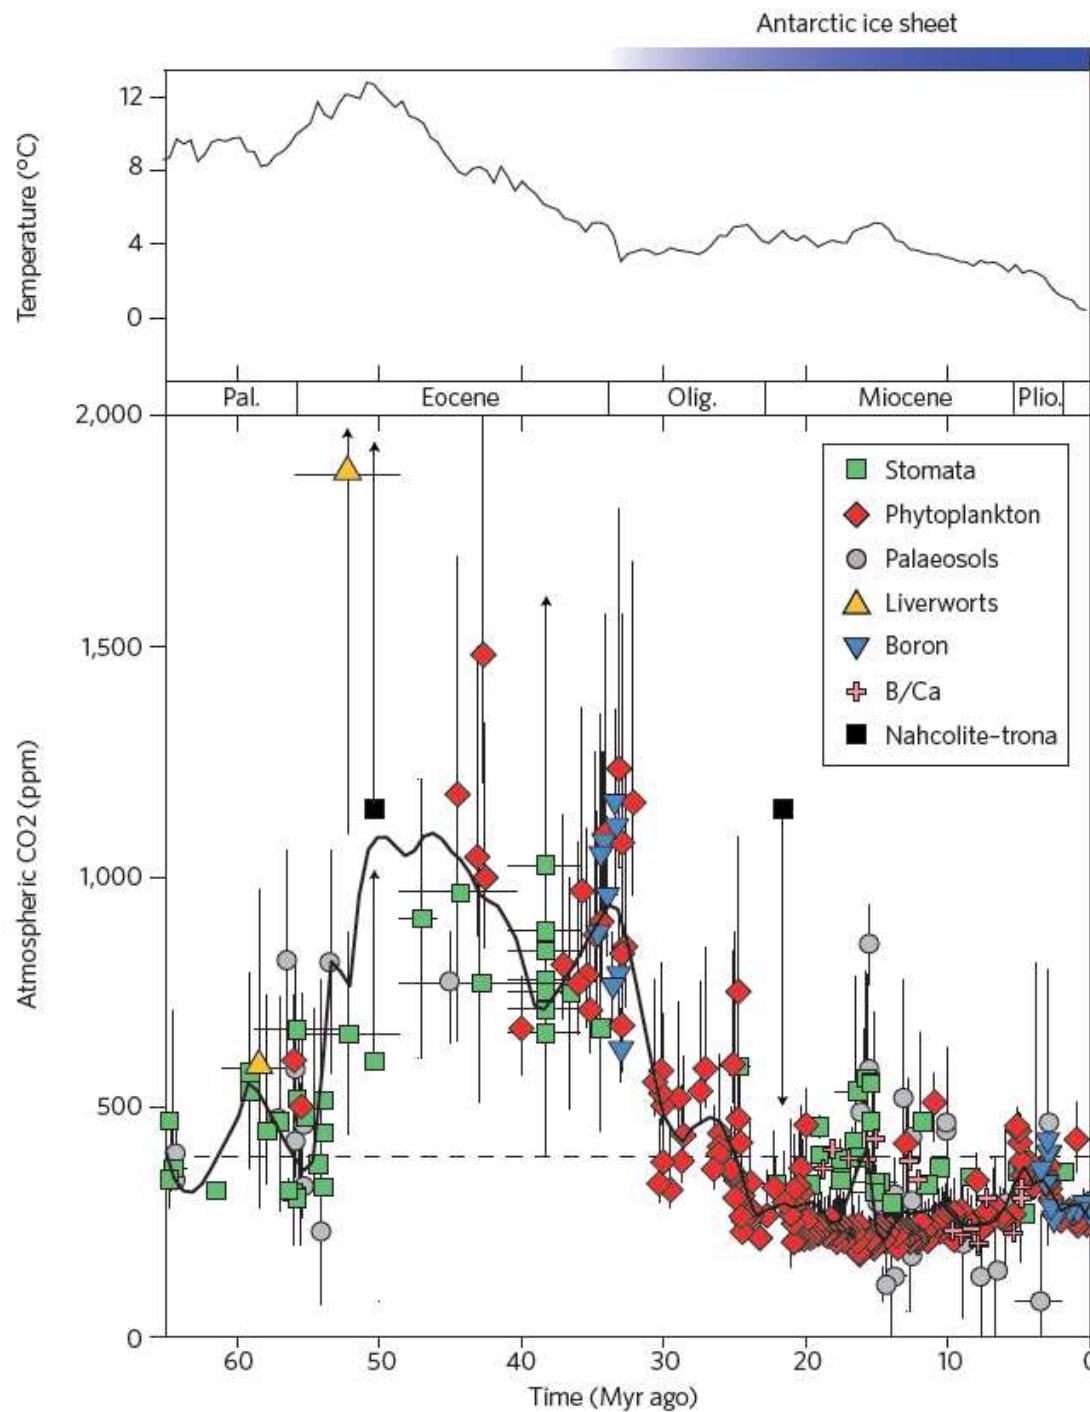

Cenozoic Deep Sea Climate Record

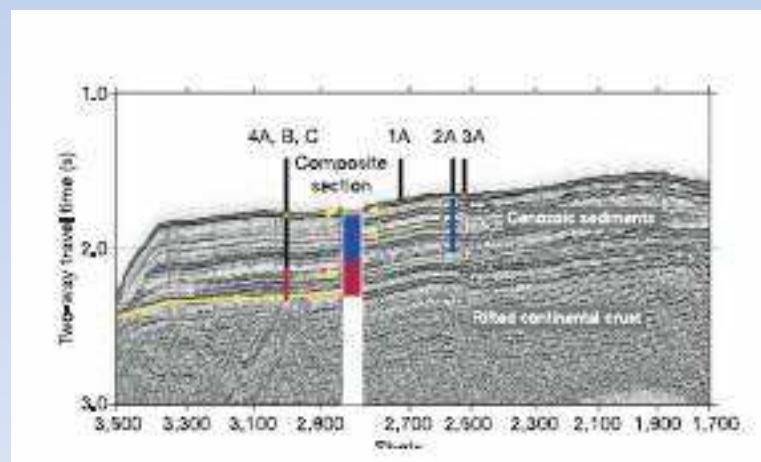

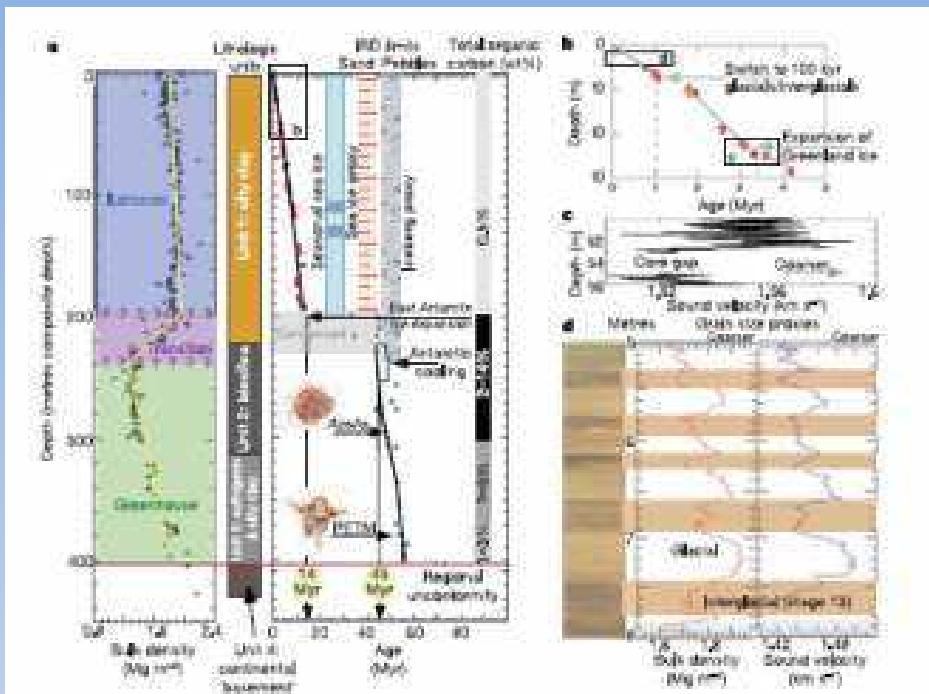

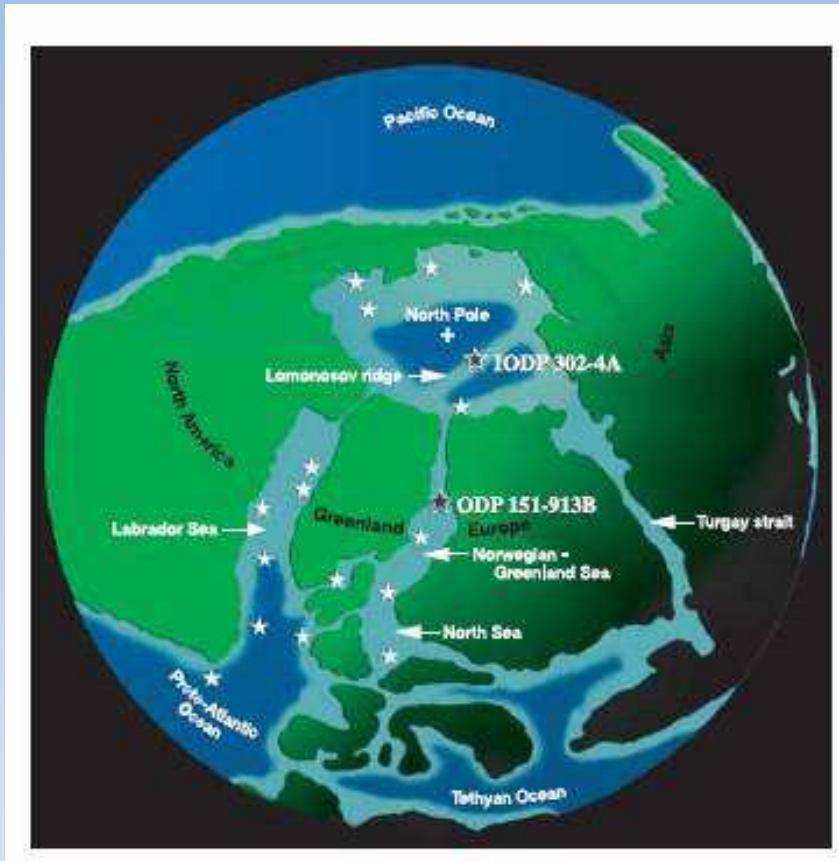

Correlation of CO₂ and temperature over last 65 million years

Beerling and Royer, Nature 2011

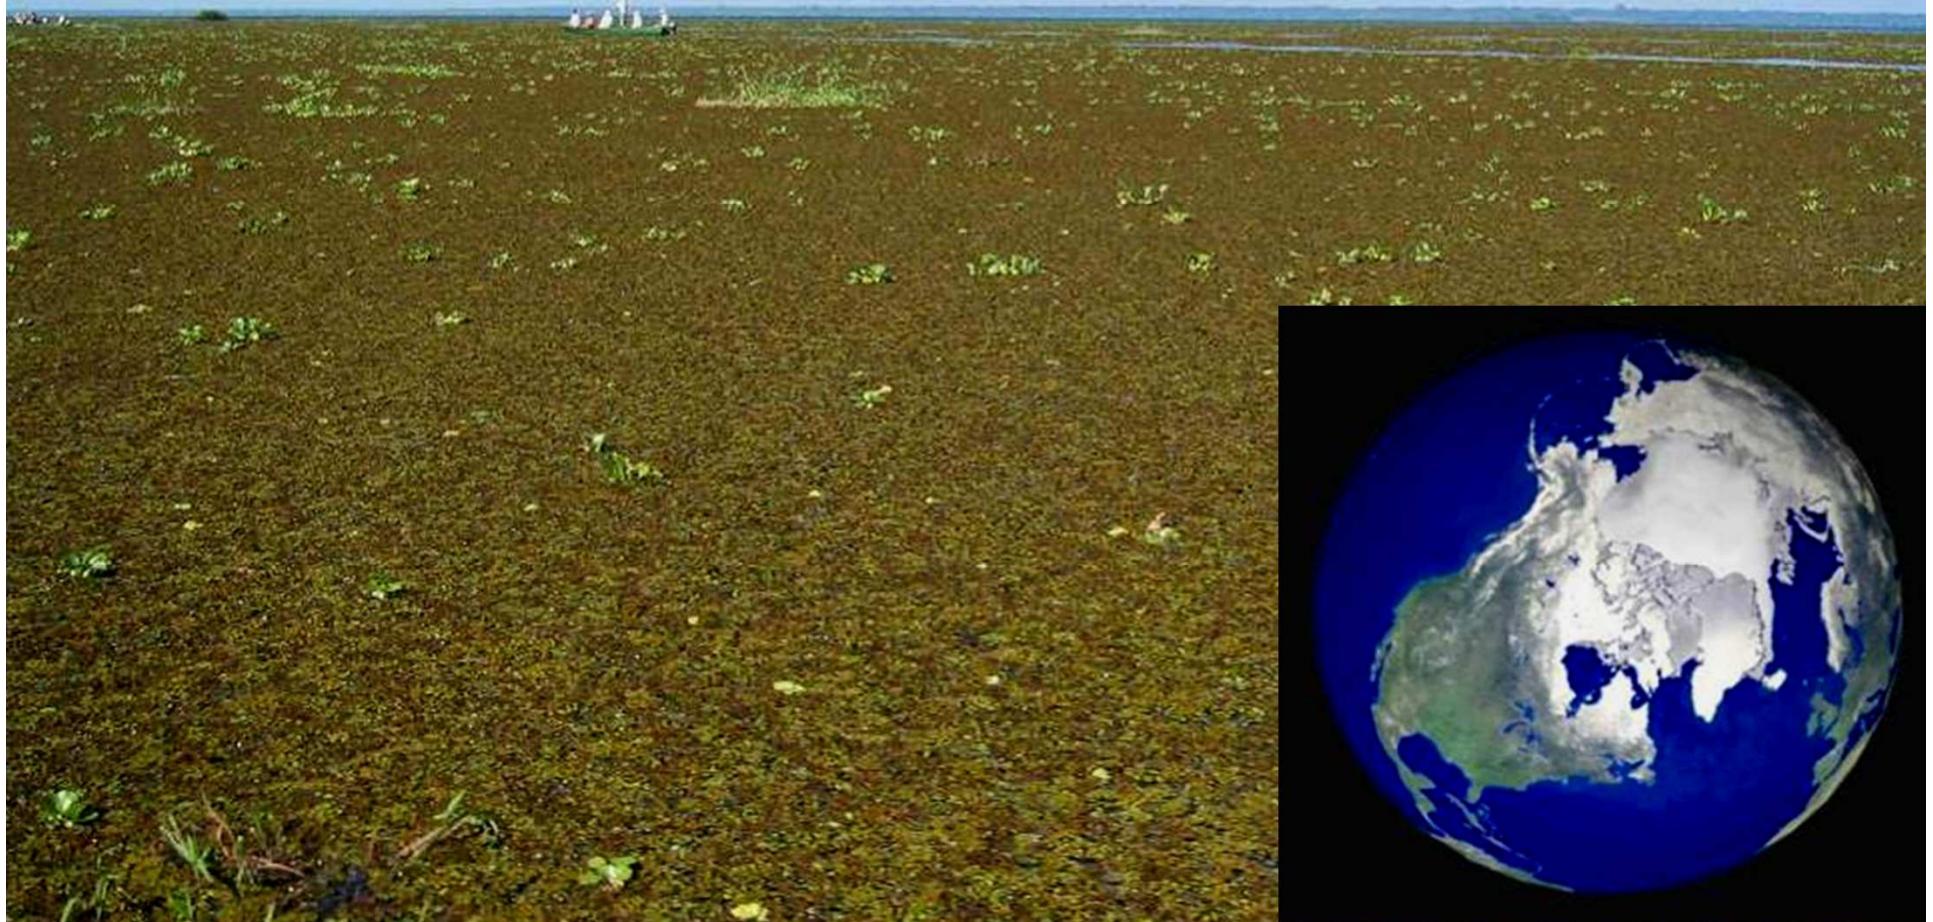

ARCTIC EVENTS

Brinkhuis et al., 2006
Moran et al., 2006

The Arctic Sea 50 million years ago

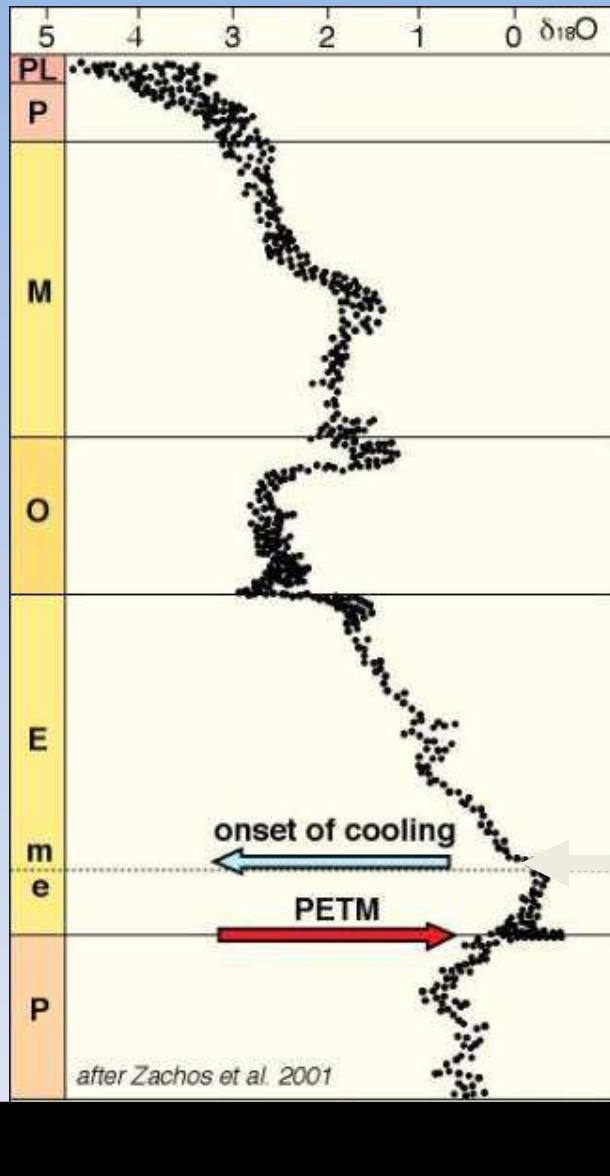

ACEX Azolla core

- >8 meter ACEX core with 90% Azolla
- Azolla occurs as laminated layers
- indicates Azolla deposited in situ
- bottom-water anoxia at ACEX site

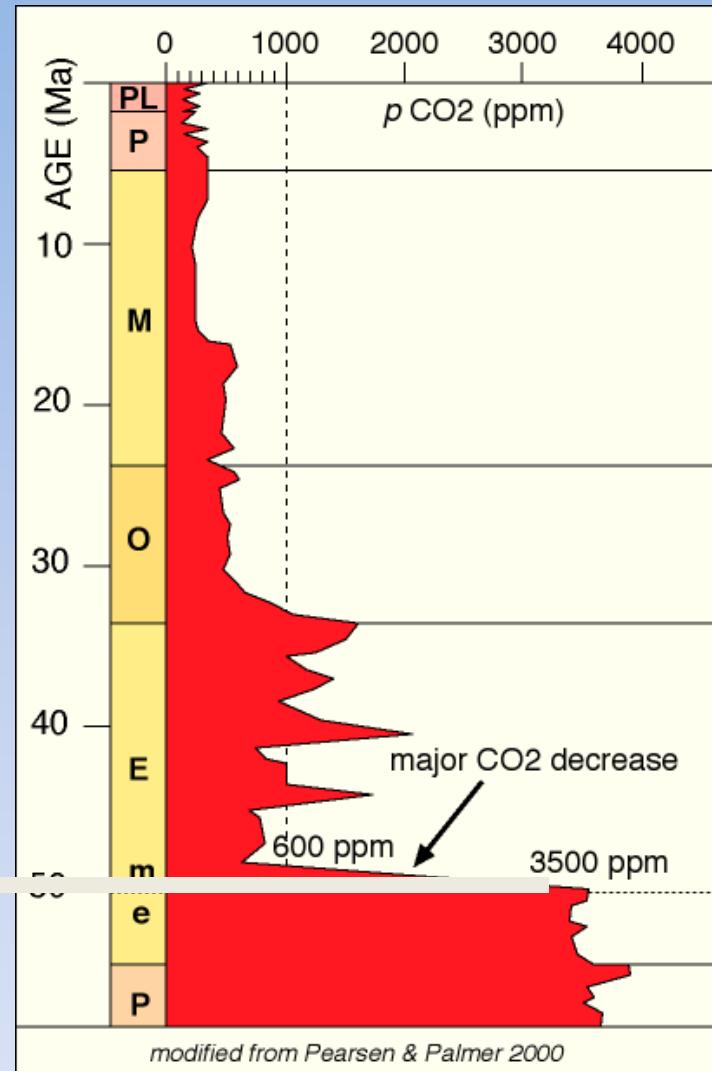

Bujak, pers. Comm.

UNPRECEDENTED DROP IN CO₂

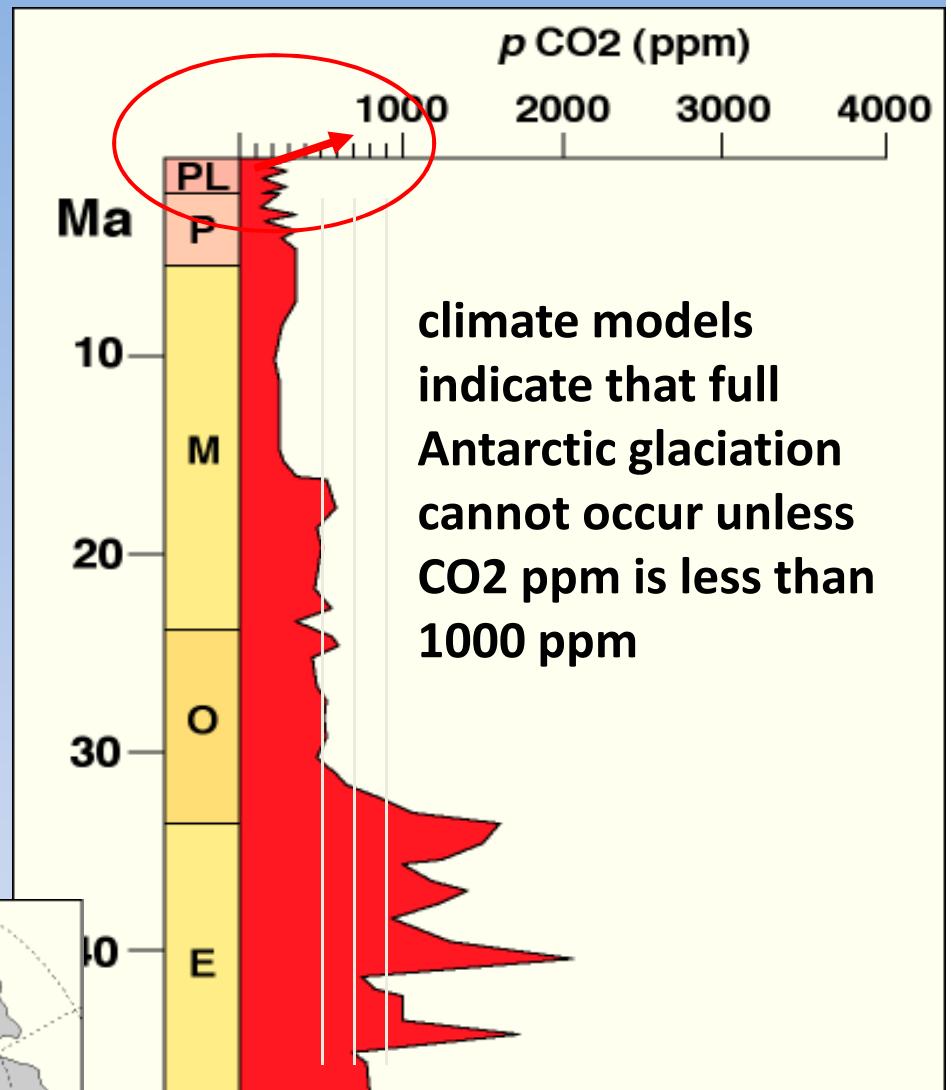

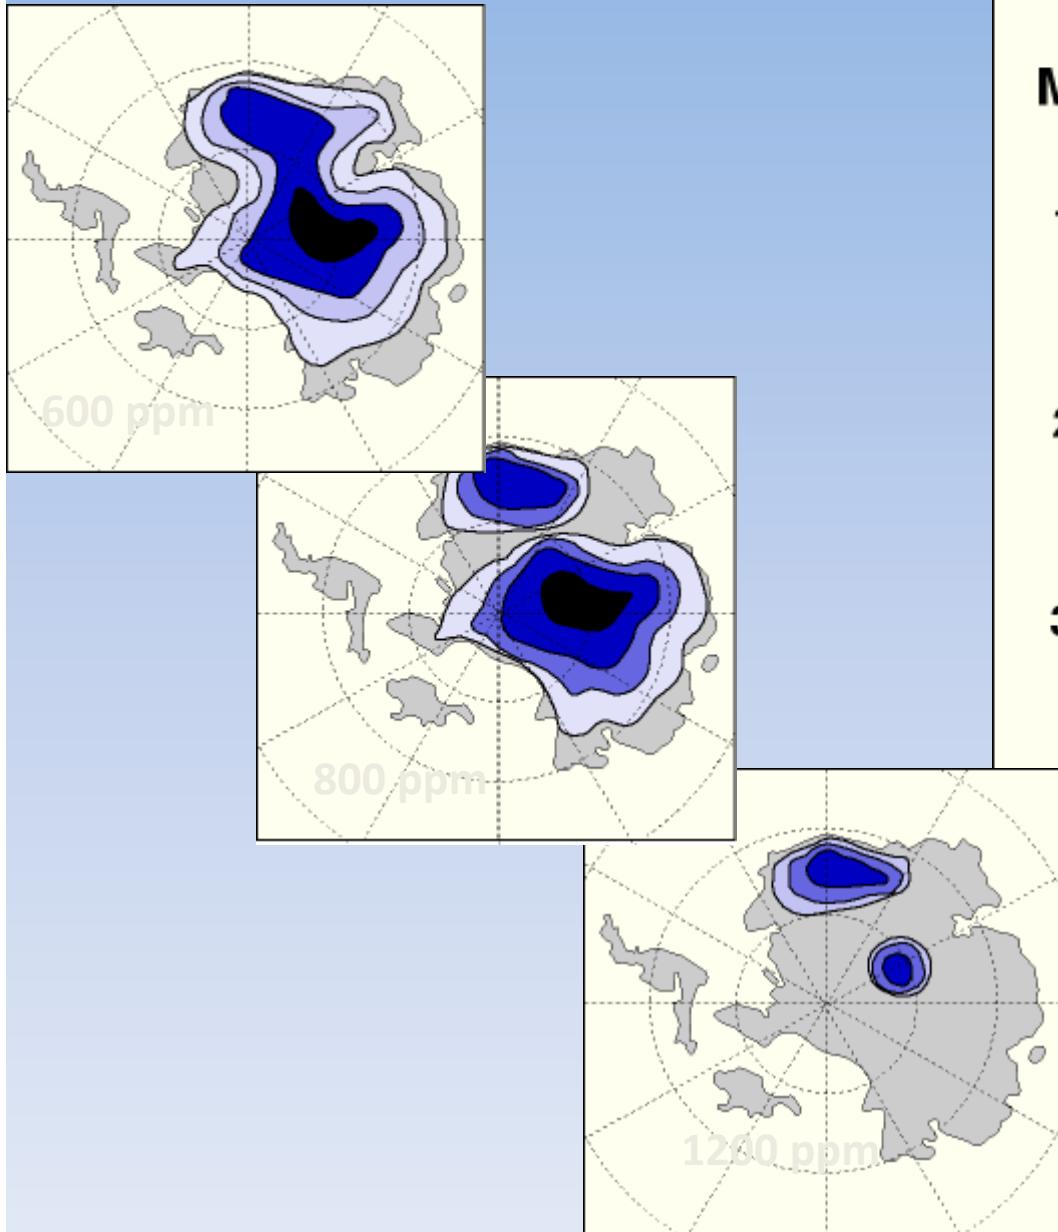

the massive
decrease in
atmospheric
CO₂?

Bujak, pers. Comm.

can this be used to predict the effect of future increases in CO₂ ?

climate models indicate that full Antarctic glaciation cannot occur unless CO₂ ppm is less than 1000 ppm

Bujak, pers. Comm.
