

# IPCC Fifth Assessment Report Synthesis Report

2<sup>nd</sup> November 2014 Copenhagen

# Key Messages

- → Human influence on the climate system is clear
- → The more we disrupt our climate, the more we risk severe, pervasive and irreversible impacts
- → We have the means to limit climate change and build a more prosperous, sustainable future

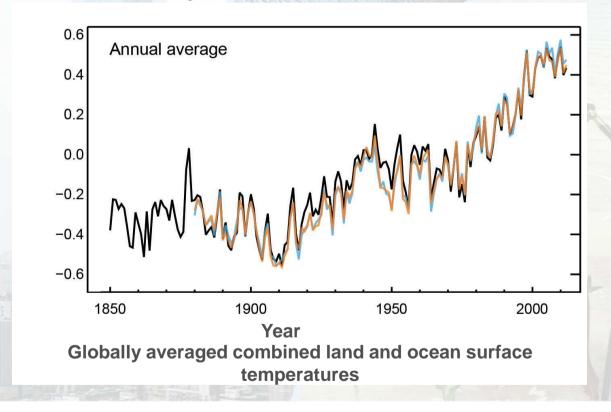

AR5 WGI SPM, AR5 WGII SPM, AR5 WGIII SPM

# Humans are changing the climate

It is extremely likely that we are the dominant cause of warming since the mid-20th century

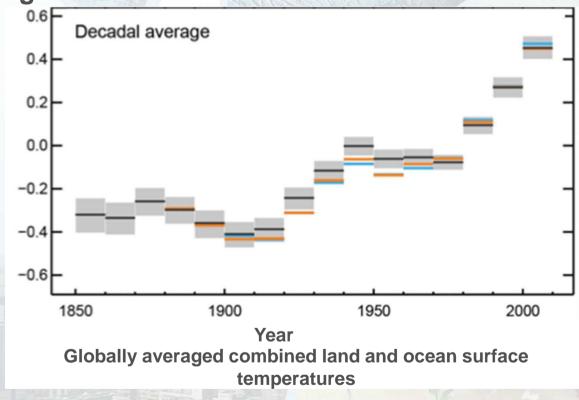

# Temperatures continue to rise

Each of the past 3 decades has been successively warmer than the preceding decades since 1850

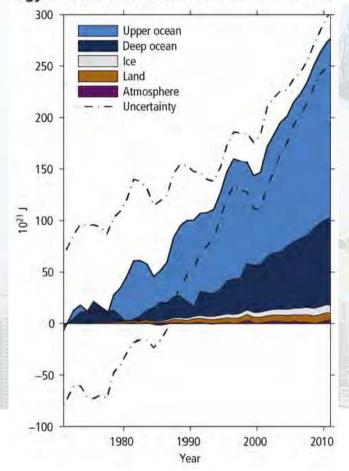

### Oceans absorb most of the heat

#### Energy accumulation within the Earth's climate system

- → More than 90% of the energy accumulating in the climate system between 1971 and 2010 has accumulated in the ocean
- → Land temperatures remain at historic highs while ocean temperatures continue to climb

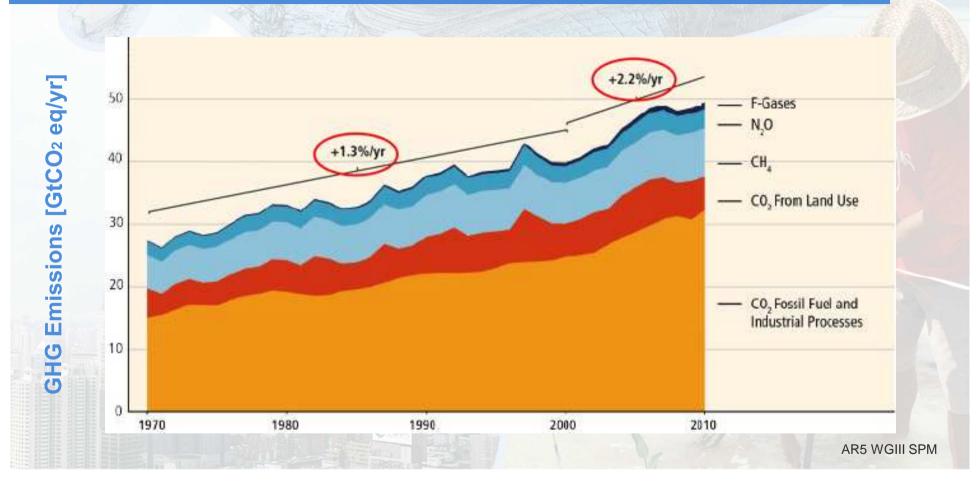

AR5 SYR

### GHG emissions growth between 2000 and 2010 has been larger than in the previous three decades

### Sources of emissions

**Energy production remains the primary driver of GHG emissions** 

Agriculture, forests and other land uses 21% Industry

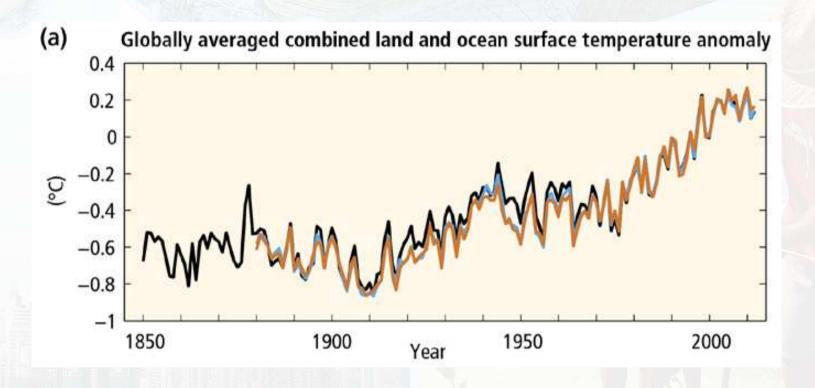

14% **Transport**  **Building** Sector

2010 GHG emissions

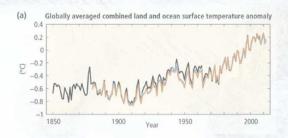

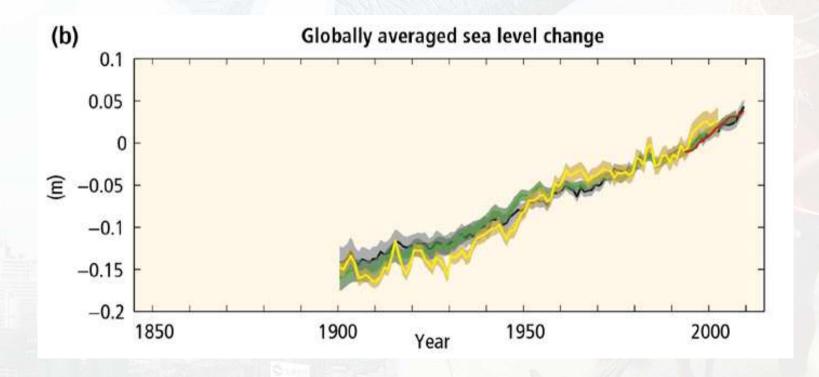

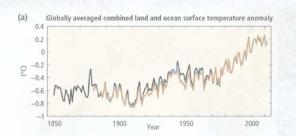

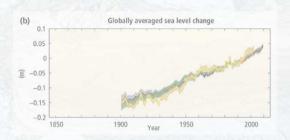

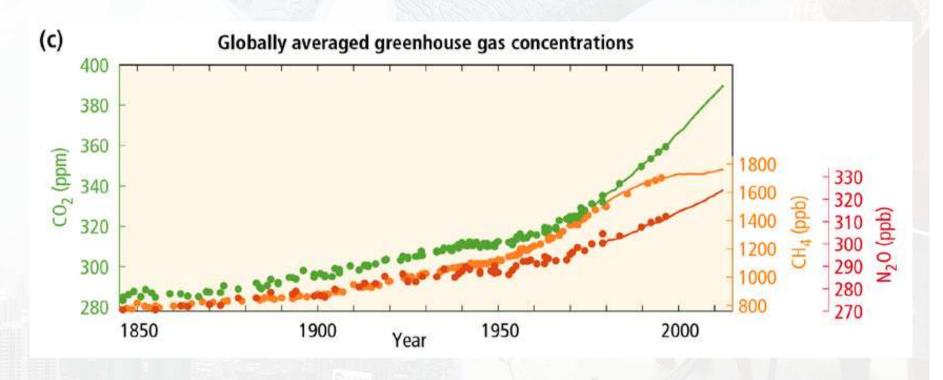

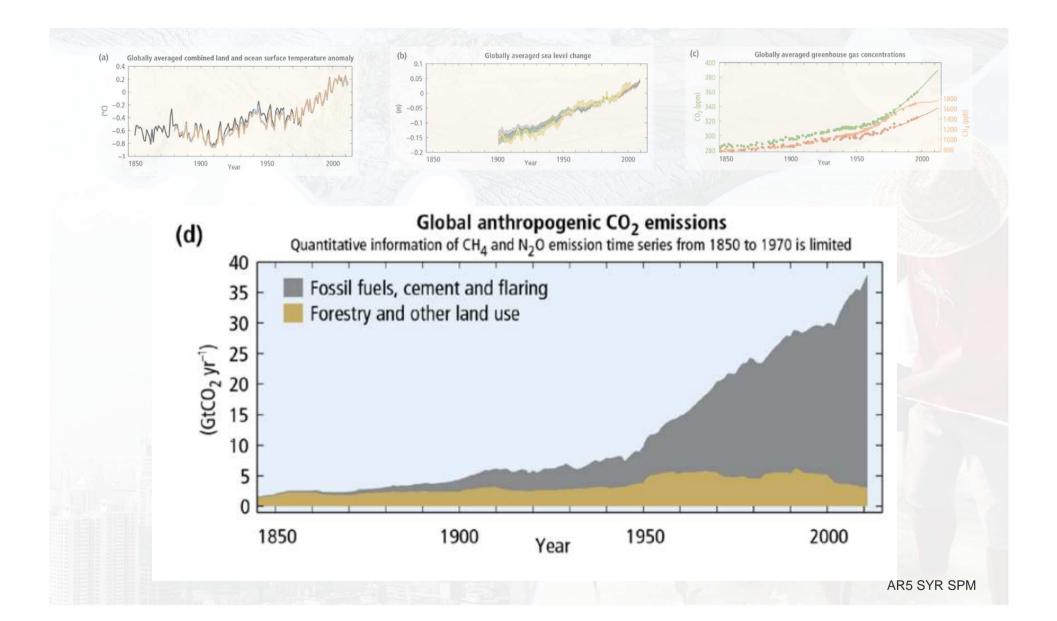

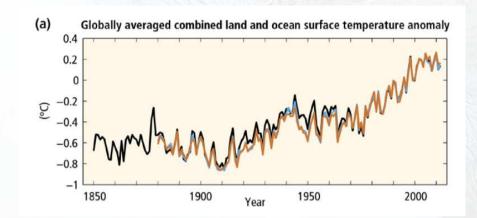

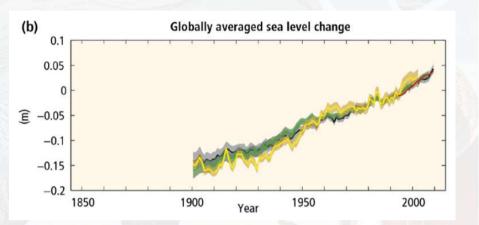

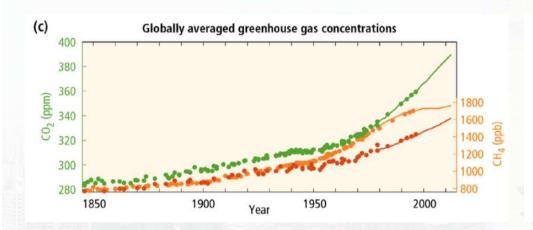

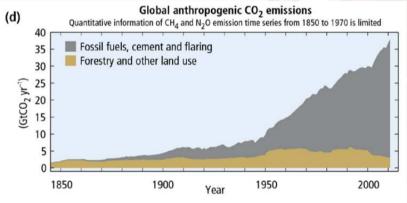

#### Some of the changes in extreme weather and climate events observed since about 1950 have been linked to human influence

### Impacts are already underway

- Tropics to the poles
- On all continents and in the ocean
- Affecting rich and poor countries

# **Projected climate changes**

Continued emissions of greenhouse gases will cause further warming and changes in the climate system

Oceans will continue to warm during the 21st century

Global mean sea level will continue to rise during the 21st century

It is very likely that the Arctic sea ice cover will continue to shrink and thin as global mean surface temperature rises

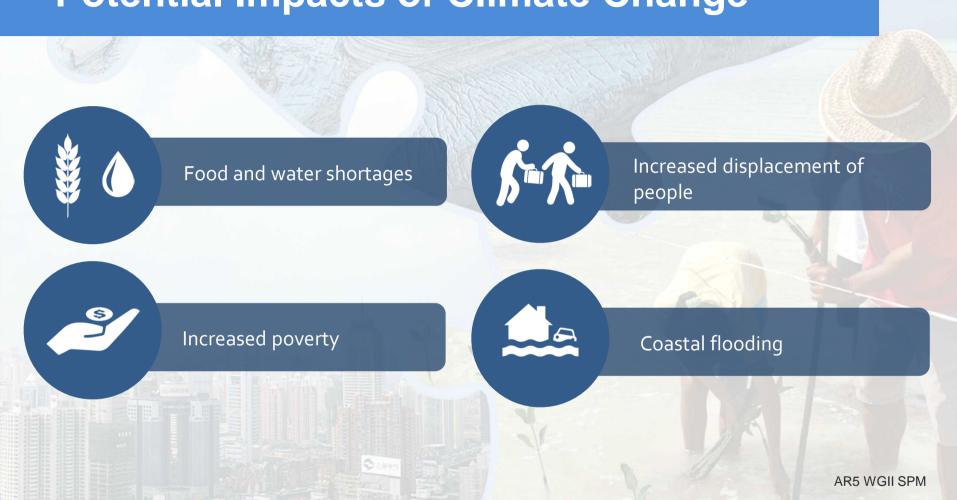

Global glacier volume will further decrease

# **Potential Impacts of Climate Change**

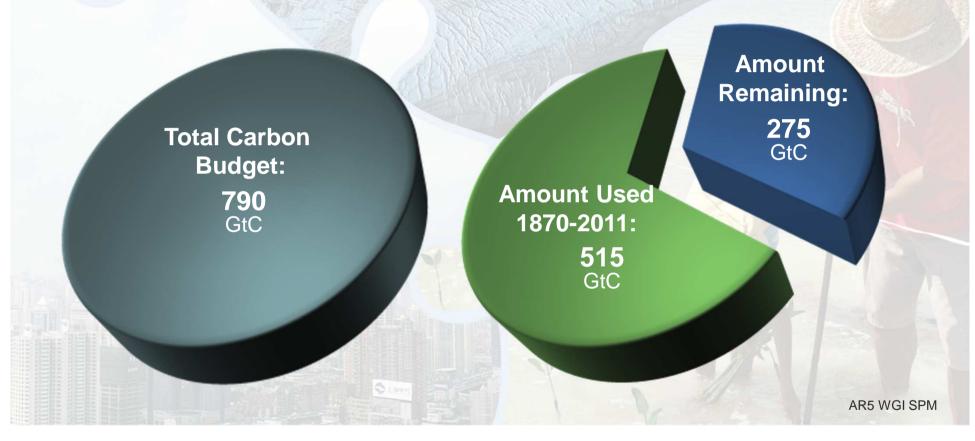

## The window for action is rapidly closing

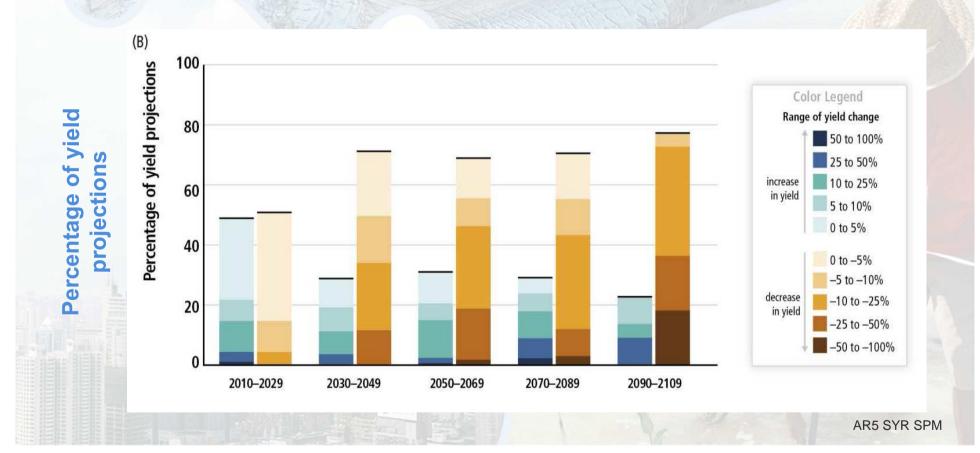

65% of our carbon budget compatible with a 2° C goal already used

### **Climate Change Poses Risk for Food Production**

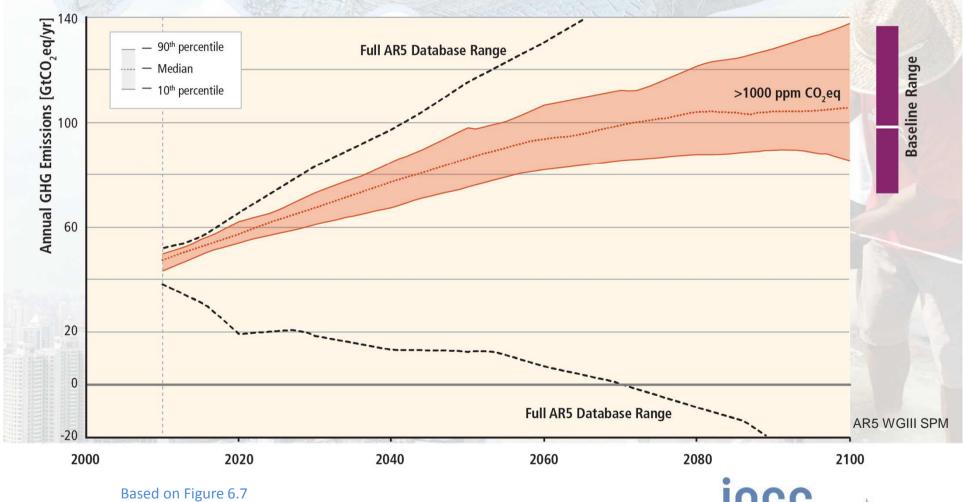

# Stabilization of atmospheric concentrations requires moving away from the baseline – regardless of the mitigation goal.

# Stabilization of atmospheric concentrations requires moving away from the baseline – regardless of the mitigation goal.

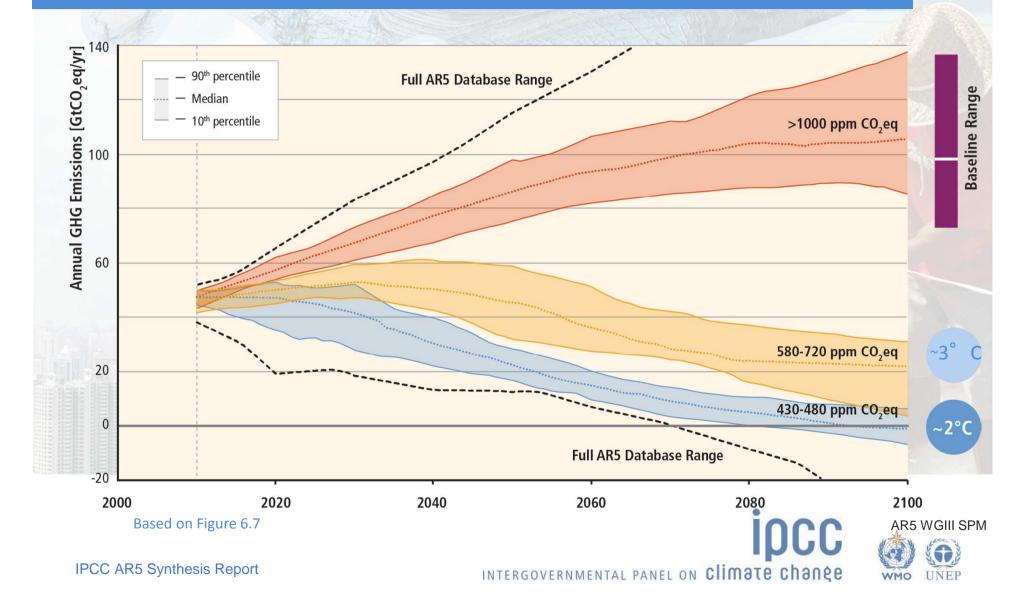

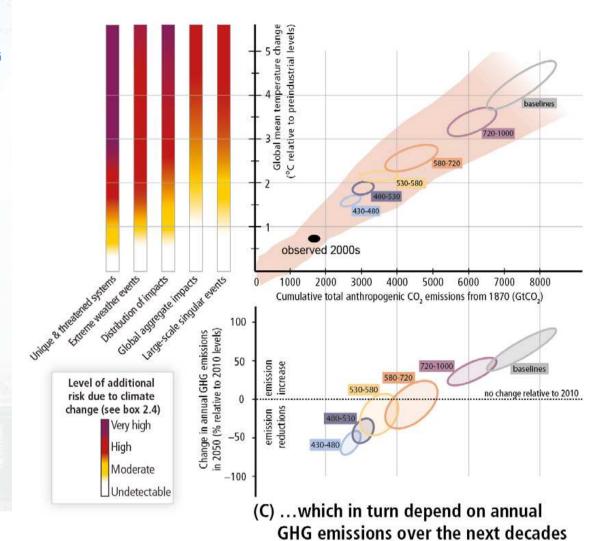

Figure SPM.10, A reader's guide

From climate change risks to GHG emissionse

(A) Risks from climate change... (B) ...depend on cumulative CO<sub>2</sub> emissions...

# Limiting Temperature Increase to 2°C

Measures exist to achieve the substantial emissions reductions required to limit likely warming to 2° C

A combination of adaptation and substantial, sustained reductions in greenhouse gas emissions can limit climate change risks

Implementing reductions in greenhouse gas emissions poses substantial technological, economic, social, and institutional challenges

But delaying mitigation will substantially increase the challenges associated with limiting warming to 2° C

AR5 WGI SPM, AR5 WGII SPM, AR5 WGIII SPM

# **Mitigation Measures**

More efficient use of energy

Greater use of low-carbon and no-carbon energy

Many of these technologies exist today

### Improved carbon sinks

- Reduced deforestation and improved forest management and planting of new forests
- Bio-energy with carbon capture and storage

Lifestyle and behavioural changes

### **Ambitious Mitigation Is Affordable**

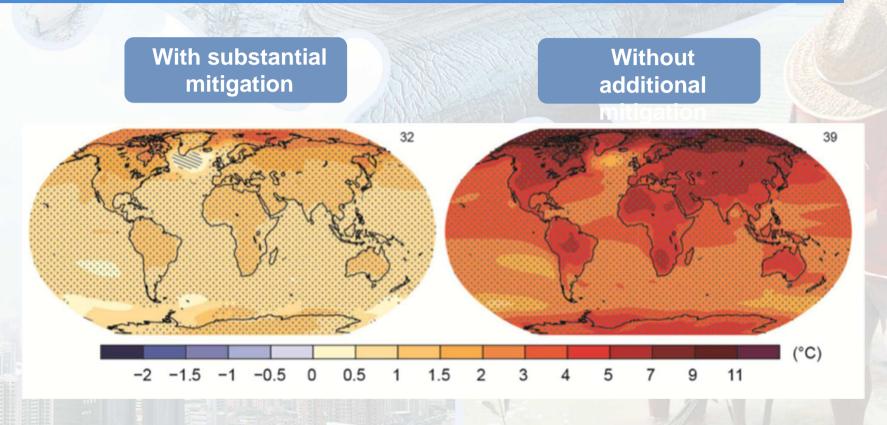

- → Economic growth reduced by ~ 0.06% (BAU growth 1.6 - 3%)
- → This translates into delayed and not forgone growth
- → Estimated cost does not account for the benefits of reduced climate change
- → Unmitigated climate change would create increasing risks to economic growth

AR5 WGI SPM, AR5 WGII SPM

### **The Choices We Make Will Create Different Outcomes**

Change in average surface temperature (1986–2005 to 2081–2100)
